Field Records September 1984

by George W. Gove, Robert H. Stymeist, Lee E. Taylor

September was a very pleasant month with the temperature averaging 62.1° , 2.5° below normal and the first cooler-than-normal month since May. The high mark for the month was 85° , set on both September 11 and 24. The lowest temperature was 40° on September 27, when the mercury rose to just 52° , a record low value for the date; the prior record low was 54° in 1893.

Rainfall totaled only 1.22 inches, 2.19 inches under the normal for September. Sunshine on the other hand prevailed 67 percent of the possible time. R.H.S.

LOONS THROUGH CORMORANTS

By midmonth migrating loons were noted flying past coastal locations. On September 15 winds were out of the northeast, and at Sandy Neck in Barnstable, observers noted 17 Common Loons, 2 Cory's, 174 Greater, and 8 Manx shearwaters, as well as two Leach's Storm-Petrels. A Brookline Bird Club trip to Stellwagen logged in 16 Manx Shearwaters on September 9. Double-crested Cormorants were moving all month with many migrating flocks reported.

HERONS

A late Least Bittern was seen in Rowley on September 26. Generally very few are ever reported after August. In 1978 one was noted at Plum Island as late as September 27; the only comparable record in the last six years was of a bird at Great Meadows on September 5, 1981.

A count of herons coming to roost at Plum Island on September 24 yielded 30 Great Egrets, over 700 Snowy Egrets, 6 Little Blue and 3 Tricolored herons. Other heron highlights included a high count of about 35 Cattle Egrets in Ipswich, and Yellow-crowned Night-Herons in Eastham and Monomoy.

WATERFOWL

The first fall Snow Geese arrived on the fifteenth at Plum Island on brisk northwest winds. Counts of ducks at Monomoy's south island were noteworthy with the following totals tallied: over 400 Green-winged and 400 Blue-winged teal, 20 Northern Pintail, 30 Northern Shoveler, and 40 Ruddy Ducks. A pelagic trip off Provincetown on September 23 provided an interesting report of 6 Harlequin Ducks. R.H.S.

TURKEY VULTURE THROUGH COOT

The hawkwatch on Mt. Wachusett reported many birds for September, particularly around midmonth. A total of 58 Ospreys was seen on September 16 and 17 as were 94 Sharpshinned Hawks. Two adult and one subadult Bald Eagles were seen at Mt. Wachusett on September 17. At Mt. Wachusett 5039 Broad-winged Hawks were seen on September 16 and elsewhere in eastern Massachusetts an additional 3895 were seen. On the seventeenth, 17,414 Broad-wingeds were counted at Mt. Wachusett. A Golden Eagle was reported on September 13 and 17, possibly the same bird, for the location was practically the same. A total of 26 Peregrine Falcons was reported.

A total of four <u>Yellow Rails</u> were reported this month! George Gavutis, former manager of the Parker River NWR, flushed (using dogs) one Yellow Rail, four Virginia Rails, and five Soras on the fourteenth at Rowley and then on September 29, he flushed <u>two</u> Yellow Rails there. Another Yellow Rail was seen at Bolton Flats on the thirtieth. The observer furnished a sketch of the bird and details which are given below.

The bird flew out from in front of the observer from an area of dense grasses and sedges growing in the water. The rail was smaller than a Sora. It had a small, chickenlike bill, and its feet dangled as it flew. It was basically golden-brown to buffy in color with an effect of dark blackish stripes alternating with brownish-buff stripes, extending from the head to the tail. The black stripes were flecked with white. The outer primaries appeared darker than the rest of the brownish wing. It had definite white areas on the inside trailing edge of the wings (the sketch gave the appearance of the speculum on a Gadwall) that contrasted with the surrounding darker wing. The observer, Mark Lynch, noted that he is very familiar with both the Virginia Rail and the Sora as he has been monitoring the populations of these two species at Bolton Flats. Based on the field marks, especially the white in the wings, he concluded that it was indeed a Yellow Rail. He searched in vain for the bird after the initial sighting.

BLACK-BELLIED PLOVER THROUGH PHALAROPES

Lesser Golden-Plover put in their usual appearance, and American Oystercatchers were present at Monomoy in the highest September number published in twelve years of BOEM records. The American Avocet continued from August at Plum Island through midmonth. Only one Willet (western race) was reported from Scituate, but the other Willets reported at Monomoy may well have been lingering breeders of the eastern race. The count of Whimbrels at Monomoy remained high and constituted the highest September count.

A <u>Eurasian Curlew</u> was seen at Tuckernuck Island early in the month, and then one was seen at Monomoy from midmonth on. Presumably, it was the same bird. This is the fourth occurrence of this species in the U.S. and the third for Massachusetts. The two previous records were September 9 through October 12, 1976 at Monomoy and February 18 through March 18, 1978 at Martha's Vineyard. These latter two occurrences were presumed to be the same individual both years. The present bird, although somewhat timid, provided many observers with spectacular views of it, both in flight and standing.

Hudsonian Godwits were present in good numbers at Newburyport-Plum Island and a maximum of six <u>Marbled Godwits</u> was at North Monomoy throughout the month. High counts of Sanderling were made at Duxbury and at North Monomoy, and the highest September count of Semipalmated Sandpipers in BOEM records was made at Newburyport. Two Purple Sandpipers were reported from Scituate.

Baird's Sandpipers continue to be noted in low numbers as are Buff-breasted Sandpipers. A <u>Ruff</u>, not a usual autumn bird, was seen in Halifax. Red and Red-necked phalaropes were seen in Cape Cod Bay on September 15 and 16, possibly as a result of northeast winds on the fifteenth.

GULLS THROUGH WOODPECKERS

Up to 1000 Laughing Gulls were present on North Monomoy at the beginning of the month. A hooded adult Franklin's Gull was reported from Tuckernuck Island on September 5. A total of six Lesser Black-backed Gulls was reported this month; these birds are now definitely regular but uncommon in Massachusetts. The occurrence and increasing numbers of this bird in Eastern North America is an interesting subject. Four reports of Sabine's Gull are in this month's records. It is difficult to tell if these are the same four birds or up to ten different birds since they were all seen in or around Cape Cod Bay within one week. The people on the September 9 BBC pelagic trip were treated to spectacular views of two adult Sabine's Gulls followed a while later by equally fine sightings of two young birds. All four of these birds were seen by many observers and photographs were taken of at least some. The date is rather early for juvenile Sabine's Gulls; therefore, if anyone has photos of these, BOEM and MAS would like to have copies of the photos to be filed with the records.

A number of Caspian Terns was seen late in the month, and Royal Terns were present on North Monomoy. Two <u>Sandwich Terns</u> were reported from Martha's Vineyard; an immature bird was seen begging food from an adult, which is typical of post-breeding terns. The nearest breeding locations are Maryland, where they are occasional breeders, and Virginia, where they are annual breeders (twenty pairs at the most). One or two other Sandwich Terns were reported from Chatham but no details of the sightings were submitted. Reports causing some concern are those of Arctic Terns on September 2 and 15. These are late dates for Arctic Terns and this species is not easily and readily identifiable by everyone. According to Bailey, "In late summer, bill coloration has changed enough to make field identification extremely difficult..." Griscom noted that "...many birds believed to be Arctic Terns in winter plumage have been collected and prove to be Common Terns." Thus, late summer reports of this species need verifying details.

Roseate Terns accumulated at North Monomoy where ten to <u>fifteen thousand</u> Common and Roseate terns were present. Forster's Terns were also present there with a maximum of fifteen counted on September 22. Skimmers were present at North Monomoy until September 23 and two adults plus twelve juveniles were seen at Orleans on September 8.

After six days of strong southwest winds, fog and northeast winds on September 15 produced many seabirds in Cape Cod Bay on the fifteenth and sixteenth from such vantage points as Sandy Neck and First Encounter Beach. These included approximately 13,000 terns, 11 Black Terns, 1 Razorbill and 1 unidentified alcid, 15 unidentified jaegers, and 117 Parasitic Jaegers.

An adult dark morph Long-tailed Jaeger was reported on a BBC pelagic trip. Several observers submitted details emphasizing the buoyant flight, slim build, and overall dark plumage with long central tail feathers. Jaegers are among the most difficult groups of birds to identify. An adult dark morph Long-tailed Jaeger is virtually unknown, allegedly occurring in a small population in Greenland. In light of this and the fact that other observers present did not agree with the identification, it is best considered an intriguing but inconclusive report.

Four to five Great Horned Owls were heard calling in the early morning hours in Ipswich and two to three were heard in Wenham. A Barred Owl and a Northern Saw-whet Owl were seen in Lakeville. Common Nighthawks continued their migration and were noted from several locations including a high number from Nantucket on the late date of September 25. Ruby-throated Hummingbirds put in an impressive showing this fall with the majority passing through by mid-month. Seventeen kingfishers were seen together at Falmouth, an impressive collection of those birds. Yellow-bellied Sapsuckers were also evident in migration with one seen hanging on the wall of the 19th floor of the McCormack Building in downtown Boston.

FLYCATCHERS THROUGH VIREOS

Several Northern Rough-winged Swallows were seen, all constituting late occurences for this species which tends to depart by mid-August. A few Red-breasted Nuthatches were reported, all from or near known breeding sites, indicating no early movement by this irruptive species. Good counts of Eastern Bluebird, totaling forty-one individuals, were tallied at Wachusett Meadow in Princeton and the Middlesex Fells in Medford. The thirty Veerys at the Marblehead Neck sanctuary on September 5 constitute an excellent count. Blue-gray Gnatcatcher reports for the month totaled thirty-two individuals, more than four times the highest September count (eight) in the last seven years. September saw several records of comparatively unusual species. A good count of Fish Crows was made in North Attleborough, a site from which they had been previously unreported. Common Ravens were reported from two sites, where they are now routine, although they are still very rare in eastern Massachusetts. The September total of three Loggerhead Shrikes is high compared to the typical single report from recent years, and stands up well against the average of five during 1973-1975. Always a treat for lucky observers, a Sedge Wren was unique at Plum Island on September 25. Twentythree Golden-crowned Kinglets at P.I. on the twenty-seventh were earlier indications of a good flight year for this species.

WARBLERS THROUGH PURPLE FINCH

The best flight of wood warblers occurred during the first week of the month as exemplified by the dates for Yellow-rumped, Cape May and Blackburnian warblers, and American Redstart. A total of thirty-two warbler species was observed for the month. Nashville Warbler reports were conspicuously low; conversely the single-day total of two hundred Cape May Warblers on Monomoy on the early date of September 2 overshadowed the previous recent high-count of 150 in September 1978. Among the less common warbler species, the sighting of two Yellow-throated Warblers was the best in recent years, and the trend is moving upward. Two Worm-eating Warblers and singles of Kentucky and Hooded warblers were about average. Yellow-breasted Chats also occurred in approximately typical numbers. Remarkably, no Connecticut Warblers were reported; the previous September low-count for this species since 1975 was five!

TANAGER THROUGH PURPLE FINCH

In major irruption years, a few Evening Grosbeaks show up in September; no luck this year. Great Meadows in Concord was an unusual inland site and an early date for the Lapland Longspur seen on September 23.

The bona fide passerine rarity of the month was Western Tanager, with two turned up on the same day in the course of the South Shore Bird Club's fall roundup. The individual

on Long Island in Boston Harbor was a well-described immature male. A single Summer Tanager report was about average for recent years. Several other uncommon but expected species, including Dickcissel, Blue Grosbeak, Yellow-headed Blackbird, and Lark Sparrow, occurred in typical numbers for September.

Erratum in September 1984 Records: jaeger sp. and Parasitic Jaeger can be found immediately following the Razorbill and are therefore out of order. The jaegers should come just before Laughing Gull.
