

BIRD CALENDAR

of the

Cleveland Bird Club

38th Year, No. 4

September-October-November
1942

Founded by Francis H. Herrick in 1905 for the
recording of Bird Activities

Edited by Arthur B. Williams, The Cleveland Museum

THE BIRD CALENDAR

This number of the Calendar, dealing primarily with the autumn migration, is considerably reduced in size due to the shortage of stenographic help in The Cleveland Museum of Natural History. The editor regrets the necessity for omittin an unusually interesting series of field notes, as well as the usual comments on the records. A large part of the work of preparing this issue was done by Mr. W. Earl Godfrey, of the Museum staff.

The number of different species of birds recorded for the year December 1, 1941 to December 1, 1942 was 243. Last year the number was 250.

Precipitation Records

For the sake of completing the precipitation record for one of the wettest years in recent history here, we include the chart at the right. Note: Each spoke of the wheel from center to circumference stands for 3 inches of water. The dotted line shows normal precipitation, the solid line, the actual record for 1942. Excess precipitation since January 1 is 5.23 inches of water (to Nov. 30).

For a spectacular comparison, get out your September-October-November 1941 Calendar and put the two charts side by side.

SPECIES LIST

(Unusual records are starred)

Note: The usual count of wintering ducks and other waterfowl along the lake front is omitted this winter due to wartime restrictions placed on observations along the lake shore. Editor
