*ERRATUM*

In the first issue of *Florida Field Naturalist* I stated (p. 11) that single Blue Jays collected on Dog and St. George Islands in December 1972 were examples of the northern race, *Cyanocitta cristata bromia*, whose breeding range extends southward to south-central Illinois, northeastern Tennessee, and south-central Virginia. These identifications were based only on my measurements of the wing chord. Recently these two specimens were sent to the National Museum of Natural History for further examination. Only the specimen from St. George Island was referred to *bromia* by M. Ralph Browning, who also pointed out that some ornithologists do not recognize *bromia* as a valid race. The St. George Island specimen is number 3157 in the Tall Timbers collection.—Henry M. Stevenson, Tall Timbers Research Station, Route 1, Box 160, Tallahassee, Fla. 32303.
