Number 4

AN EXCURSUS FROM ASTRONOMY: MIGRATING BIRD OBSERVATIONS

Robert H. McCracken

During extended telescopic observing periods, one frequently sees birds cross the lunar or solar disc, occasionally at quite high altitudes. I suppose I have ignored many hundreds of such transits, perhaps while some ornithologist was ignoring a rare class-III solar flare. While examining sunspots near noon on June 4, 1961, however, I suddenly became aware of a surprising number and altitude of birds transiting the sun. A long-standing semi-question emerged: How high do birds fly?

A delightful distraction! I drew a 75 mm. diameter circle on white bond. Within it, with the aid of a magnifying loupe, a scale, and a finely sand-sharpened pencil, I drew a series of marks spaced 0.5 mm. apart, and a series of small dots, which I measured and labeled-- 0.25 mm., 0.4 mm., 1.0 mm. With the image of the solar disc projected* by my 83 mm.-aperture refractor to fit into the 75 mm. circle, the bird images could quickly and easily be measured. Hand-holding the paper on a clipboard so the scale or an appropriate dot could be brought alongside the image. I found the tiniest images to be smaller than the smallest (0.25 mm.) dot, or about 0.2 mm. Because of the irregular image, the flapping wings, etc., I simply estimated the mean diameter of the image - somewhat shorter than the wingspan, but perhaps somewhat longer than the body.

Of course, most birds were at lower altitudes; there were many large, out-of-focus images. At times there were as many as ten per minute, but only occasional ones were in the apparently highest-altitude group. Of these there seemed to be two speed groups,

* Never look directly at the sun, even for an instant, with any telescope or binoculars, unless, of course, it is especially equipped for the purpose. Dark filters at the eyepiece are not sufficient. They frequently crack because of the heat, quickly dumping the concentrated solar rays into the eye. Permanent blindness will likely result.

The solar image may be safely projected onto a screen held a short distance from the eyepiece by simply refocussing. Then a group may observe.

one crossing the sun in about five seconds, the other requiring about 20 seconds for the transit. All seemed to be travelling in the same general direction, approximately east-northeastward. With one exception all were flying hard, as with a purpose. The one fellow seemed to loiter a bit, entering the disc from the west, hesitating, drifting for a time without flapping, as I recall, then turning off about 50° or 60° toward the north. He appeared to be a tired or confused member of the 20-second group.

I was rather startled by a quick mental approximation of altitude, whereupon I drew a 30 cm. circle and confirmed the measurements. On the larger image, the birds were about 0.8 mm. across.

The sun's diameter subtends an angle at the earth of very nearly one-half degree. An image diameter of 0.2 mm. on the 75 mm. projected solar image, then, is $0.2/75 \times 1/2$ degree, or $1/750$ degree, or $1/43,000$ radian. For small angles, where $\tan \theta = \theta$, the distance of the bird is 43,000 diameters. At noon on June 4 the sun's declination is about 22° north, which at my latitude, 39° , corresponds to an altitude of 73° above the southern horizon. The altitude of the bird is $\sin 73^\circ \times$ distance, or $0.97 \times 43,000 = 42,000$ diameters! A 12 - inch bird at 42,000 feet? A nine-inch bird at 31,000 feet? A six-inch bird at 21,000 feet? Or a four-inch bird at 14,000 feet? Winds both at the surface and at the 19,000 foot level were nearly calm, as a high pressure area was centered over West Virginia at that time.

Consulting Mr. Chandler S. Robbins, Biologist, of the Patuxent Wildlife Research Center, I learned that there were warblers migrating that weekend, somewhat later than usual. The observed directions seemed rather more easterly than one would expect, Mr. Robbins said, but after checking the winds aloft, he felt that the direction was accountable. But the altitude!

Since then I have checked briefly on several occasions. The few transits I saw during the summer were low, often out-of-focus images, and too few to define any pattern. With the onset of autumn, I expected more observations. A short check made near noon on September 23, 1961, from 12:18 to 12:25 E.S.T. showed no birds, although surface winds at National Airport were from WNW at 5 knots (U. S. Weather Bureau).

The moon was nearly full on the night of September 23-24, when a short observation near the meridian - from 00:10 to 00:25 - yielded 21 birds. Twelve more passed in another seven-minute period. The smallest image, if that of a 6-inch bird, was at about 4,000 feet; most appeared to be under 2,500 feet. Directions were generally toward the southwest. Surface winds were from the south at 3 knots.

On September 24, from 11:12 to 11:42 E.S.T., thirteen birds transited the sun, mostly in the first few minutes. Winds were 5 knots from NNE at 11, 2 knots from ENE at noon. During the last half of the observation, between the 10th and 11th transits, there was a ten-minute period which yielded not a single bird.

Of the thirteen, the smallest image was about 0.75 mm. in diameter, corresponding at this time to an altitude for a 6-inch bird of about 4,500 feet. Most were lower.

In ten minutes on the night of September 24-25, from 11:35 to 11:45 E.S.T., I saw 35 birds cross the face of the full moon. The smallest, if a 6-inch bird, was at a distance of approximately 4,700 feet, or an altitude of 3,600 feet. It was interesting to see some of those at an intermediate altitude "crabbing" into a high wind. They were facing somewhat northwest, but flying southwest.

Although the rate had dropped considerably by the following Sunday, On October 1, in 23 minutes near noon I logged five birds that crossed the sun - two at about 4,500 feet, one at 5,250 feet, and one at nearly 6,500 feet. The fifth one was at a low altitude. All these altitudes assume a six-inch bird, and are corrected for the solar angle. Surface winds were NNE at 3 knots.

Although my bird observations as an astronomer are entirely too few, too short, and too irregular to hazard any generalized conclusions, they have raised a few questions in my mind, and have prompted me to comment - albeit naively - on the subject:

1. Distribution, both spacial and temporal, seems irregular. Flight patterns seem either lumpy or streamy, probably the latter, judging from breaks in the observations. Groups of appropriately spaced observers projecting the sun might determine both distribution and altitude. Perhaps they have.

2. Some low, out-of-focus birds transit rapidly enough to be easily missed.

3. Sometimes birds at different altitudes may consistently fly in different-even opposite-directions. Perhaps because of winds.

4. Some birds may fly higher in daylight than at night, perhaps because of better visibility. Measurements of altitudes against the crescent or quarter moon compared with those against the full moon may be indicative. I understand that counts have been made in this way.

5. Direct telescope observations of the day sky are likely to suffer from "empty-field myopia", because eyes tend to focus not at infinity, but perhaps at arm's length, when not guided by objects in the field. The small images of high-altitude birds, out of focus on the retina, may thus usually be missed. A very fine reticle placed precisely at the prime focus and always kept in view while observing should solve the problem. It could also be used to measure the images. If displaced by a precisely-controlled distance from the prime focus, it may assist in making measurements within only a selected altitude range. Venus or a bright star might sometimes be used to keep the eye focused at infinity in the daytime, but finding and keeping Venus or a star in the field of vision entails complications.

6. There must be an awful lot of birds!

5120 Newport Avenue, Chevy Chase

SANDHILL CRANE ADDED TO MARYLAND LIST

Richard L. Kleen

An immature Lesser Sandhill Crane (*Grus canadensis canadensis*) was shot in a cornfield near McDaniel, Talbot County, Maryland on November 19, 1961. This is the first record of the Sandhill Crane from the State of Maryland, and the third record of this subspecies from the United States east of the Mississippi River.

The bird was brought to the writer for identification. Measurements of the culmen indicate that it is a Lesser Sandhill Crane, the subspecies that breeds in northeastern Siberia, Alaska, Yukon, and the Northwest Territories. Normally this race spends the winter in California, Arizona, New Mexico, Texas, and Mexico.

According to Dr. Lawrence H. Walkinshaw in his monograph, The Sandhill Cranes (Cranbrook Inst. of Sci. Bull. 29, 1949), there have been only two previous records of the *canadensis* subspecies of the Sandhill Crane in the part of the United States lying east of the Mississippi River. One was a bird recorded in Natick, Kent County, Rhode Island on October 8, 1889. The second was recorded at Mt. Pleasant, Charleston County, South Carolina on October 21, 1890. There also are two records for Prince Edward Island, Canada, in 1905.

The crown and forehead of the Talbot County specimen were less red and less carunculated than in typical adult birds, and many of the wing coverts and some of the secondaries were tipped with brown. These are the two prime indications that the bird was immature.

Of the four subspecies of the Sandhill Crane, three have culmen measurements that range from 113 to 159 millimeters. The *canadensis* race has culmen measurements that range between 69 and 110 millimeters. As the culmen of the specimen in question measured 75 millimeters, we conclude that it was of this small subspecies and constitutes an authentic record of the Lesser Sandhill Crane.

St. Michaels

BROWN THRASHER WINTERING IN PIEDMONT

Hervey Brackbill

It appears to be extremely unusual for a Brown Thrasher (*Toxostoma rufum*) to winter in the Piedmont of our State. In "Birds of Maryland and the District of Columbia," North American Fauna 62:241, 1958, Stewart and Robbins record no such occurrence through 1955, and a search of Maryland Birdlife for the years since then discloses only two records prior to the 1960-61 season. In the winter of 1956-57 a Brown Thrasher was seen at Fullerton, just outside the northeastern corner of Baltimore City; no dates are given (Maryland Birdlife 13:39, 1957). And from December 15, 1958, through March 28, 1959, one wintered at the Robbins' feeding station just west of Laurel (Maryland Birdlife 15:67, 1959).

For the severe winter of 1960-61 several occurrences were reported (Maryland Birdlife 17:61, 1961), and I have another to add. While the heavy snow of mid-December blanketed the area, a Brown Thrasher appeared at my home in Larchmont, which is just outside the mid point of Baltimore's western boundary, and spent the winter, coming to my feeders daily. It was first seen December 19, was color-banded January 8, and was present through March 28. The similarity of these wintering dates to those Rob-bins observed in 1958-59 is remarkable. Not until April 17 did I begin to see migrant or summer-resident thrashers.

What patterns might appear if we knew the full stay of all unusual winterers that birders encounter? Such close correspondences, however, surely are not always to be expected; a thrasher banded at White Marsh on December 15, 1960, was seen only through January 27 (Maryland Birdlife 17:61, 1961).

2620 Poplar Drive, Baltimore 7

IS THE CARDINAL RED?

Richard L. Kleen

There is always great excitement at the compilation of a Christmas Bird Count. Reports of unusual species observed or of unusual numbers recorded are met with applause or with scoffing—depending upon the nature of the listener or sometimes upon the nature of the reporter. So it was to be expected that a golden-yellow Cardinal, reported on the St. Michaels Christmas Count on Jan. 1, 1961, would cause the skeptics to be incredulous. The observers, Jan Reese, Joe Spurry, and Chris Bryan, defended their case with eloquence, but there were still unbelievers, and I am sure that many drove home that evening firm in the belief that the Golden Cardinal was a purely illusory creature—the figment of someone's post-New Years Eve imagination. However, the score or so of birders who have since seen this unusual bird should be large enough in number to convince the most dedicated skeptic.

The underparts of the bird are bright yellow, similar in coloration to the underparts of the meadowlark. The yellow extends from the breast to the crissum. The crest, head, neck, and rump are of the same bright yellow color. The back, the wings, and the tail are olive-yellow. The throat, lores, and area surrounding the bill are black, as in the typical male Cardinal.

The actions and notes of the bird are inseparable from those of the normally plumaged individual. Its wintering area includes an overgrown hedge, a series of brush piles, and a number of twenty-foot cedar trees all within an area of about two acres. The only other fringillids seen during all observations in the area were a number of White-throats and Song Sparrows. There also was a Mockingbird that intermittently drove the Cardinal from a favorite perching position on one of the brush piles. On a number of occasions a normally plumaged female Cardinal (Richmondena cardinalis) was seen to be present in the area, but no fraternization was noticed.

The reasons for this aberrant plumage have been constantly discussed in Talbot County since the discovery. Various suggestions have been put forth, but the following has received most credence. Wallace (1950:50) informs us that the colors which birds assume are derived from two sources: from the refraction of light rays and from natural pigmentation in the feathers.

With few exceptions, the greens and blues that we see in the feathers of birds are derived from the refraction of light rays by feather structure. We are not concerned with this type of coloration at present.

Most of the colors observed in birds are derived from pigmentation. There are only four pigments present in feathers: a black or blackish-brown pigment known as eumelanin, a pigment called pheomelanin that ranges from dull brown to dull yellow, a red pigment known as zooerythrin, and a yellow known as zooanthin. The countless shades and hues found in the plumages of birds are based on the concentration of the pigment color or on combinations in various strengths of two or more of the basis pigment colors. When the pigment-producing cells of a bird do not function properly, an absence of color results. Such a bird is albinistic; it is known as an albino.

Looking at the bright redness of the Cardinal, it would be assumed that its color is derived entirely from the red pigment, zooerythrin. Is it not possible that, in reality, the color of the Cardinal is caused by a combination of the red and yellow pigments, with the strength of the red pigment such that the yellow zooanthin is not noticeable in the normal bird? With out aberrant individual, the factors needed for red pigment production may be lost. However, the yellow pigment-producing cells may be behaving normally. Thus we would have an albino, as far as the red pigment is concerned. The absence of the red color permits the yellow to be seen and we have a yellow Cardinal.

The coloration of the back also posed an interesting question. It has been described by observers as greenish-yellow or olive-yellow. What possible combination or concentration of pigments would produce such a color? Allen (1925:60) mentions that the combination of eumelanin and zooanthin, in concentrated form, will produce a yellowish-olive-green color.

Thus it would appear that, instead of the Cardinal deriving his color entirely from the red zooerythrin, its coloration is derived from the combination of three concentrated pigments: brown-black eumelanin, red zooerythrin, and yellow zooanthin. The absence of red pigmentation in this individual has made a hidden fact more obvious to us. It would appear that additional observations of aberrant individuals may give us more clues to the mysteries concerning pigmentation.

ROCK RUN SANCTUARY'S FIRST YEAR

C. Douglas Hackman

Rock Run Sanctuary is now over one year old!

In this first year Rock Run has been the scene of many varied activities. Many MOS members have devoted a great deal of time and effort to such important projects as: the repair of the house, the establishment and maintenance of a lawn, the rebuilding of stone walls and steps, the erection of bird houses and feeders and the establishment and marking of bird trails. Others, through gracious contributions, have provided the furnishings for the house and the tools with which the many jobs have been accomplished. The Junior Group, under Mrs. Schaffer's direction, has made frequent visits in search of everything from insects to birds. Several scout groups and nature clubs have come out to be instructed and guided around the trails by some of our experienced leaders. This summer a Breeding Bird Census was made on the study area and a Winter-Bird Population study is being planned. An Operation Recovery Banding Station was operated there this fall and close to 500 birds of 49 species were banded. These included a Saw-whet Owl, Sharp-shinned Hawk and Connecticut and Mourning Warblers. And finally, over 1,000 MOS members and their friends signed the Sanctuary register and observed 145 different species of birds within the Sanctuary boundaries.

A wildlife sanctuary, if it is to reach its full potential, should have several important functions. First, as implied by the name, it should be a haven for all forms of plant and animal life. Secondly and equally important, it should serve as an educational center that is designed to demonstrate to the public the need and absolute necessity for a sound and comprehensive conservation program. Thirdly, it should be the center of an intelligent research program with the stated purpose of contributing to our understanding of the vital needs and requirements of our existing wildlife populations. Finally, and rightfully so, a sanctuary should serve as a recreation area for the members of the organization to which it belongs - a place to which they can retire, away from and unhindered by the public, in order to study and observe. The first year of activity, and the development that has resulted, have been fully in keeping with these aims.

A great deal has been accomplished. However, now is the time to start taking fuller advantage of the many fine opportunities offered to us by Rock Run's unique habitats and excellent bird, plant and animal populations. Up to the present time only a few of the many visitors have taken the time to fill out a checklist. There are no lists of the various species of plants identified, or of animals. As yet, we don't even know what we have!

Our next step should be to record such lists and to learn just where everything is and how abundant it is. Unless we do so, several years from now we will have no idea regarding changes that may have occurred.

Now is the time to begin recording such things as arrival and departure dates of birds. Now is the time to determine the normal summer and winter bird populations. As our cities continue their relentless expansion, eating into our farmland and woods, such information will become increasingly important. Today, it is relatively easy to accumulate information. Ten or twenty years from now the same information will be much harder to obtain and evaluate. Future ornithologists will not have the information necessary for accurate evaluations of the changes wrought by the spread of urbanization unless the observers of today have the foresight and initiative to gather it.

Arrival and departure dates or peak migration dates with actual counts and estimates of migrating flocks are of great importance - especially when such counts are further documented by comments on flight direction, estimated altitude and speed of migrants, time of day and a short, concise weather summary. Observations on virtually every phase of birdlife can be of significant value. A thorough knowledge of our native plants, their location and abundance is imperative, for we must observe and understand the changes that occur in them before we can evaluate the changes in our bird populations.

As a group we are in an excellent position to make many worthwhile contributions to the present knowledge of Maryland's birdlife because of the diverse interests of our members. Many of the members are interested in various groups of plants such as the ferns or the grasses. Others are more interested in reptiles and amphibians. Almost all of us have some interests aside from birds. Now is the time for each of us to put our special interests and talents to work.

Every member of the MOS, whether he or she is a novice or an expert, can help in this collection of information. Cataloging all of the various forms of plants and wildlife and then keeping records of our day-to-day bird population will not require a great deal of time or effort from any one individual. It can, and should be, a project shared in equally by all. Each of us, by taking a few short moments from each trip to record a pertinent observation or two, can make visits to Rock Run more profitable and rewarding to ourselves and at the same time contribute to the overall purpose and value of our Sanctuary.

Lilac Lane, Perry Hall

THE PRESIDENT'S PAGE

The Valley Beyond the Shining Mountains

In Baltimore last March some 600 members and guests of MOS enjoyed a screen lecture by Hal Harrison entitled "Beyond the Shining Mountains."

"The Shining Mountains" is a term applying in general to our Rocky Mountains and in particular to the Mission Range of the Rockies, which runs roughly from Glacier National Park to about Missoula, Montana.

THINGS TO DO IN JANUARY, FEBRUARY AND MARCH

Douglas Hackman has suggested that we set up a regular column for "Things To Do," directed primarily toward beginners. We would appreciate your comments on this idea. In the meantime, we are using a few lines under this heading to call your attention to some deadlines and some requests for assistance, and to mention recent bird observations.

HELEN B. MILLER AUDUBON NATURE CAMP SCHOLARSHIP applicants should apply in writing to President Seth H. Low by Feb. 1.

Mail 1961 COUNTY BIRD LISTS by Jan. 10 to John S. Weske, 304 Main Street, Etna, N.Y.

NEST RECORDS for 1961 should be sent immediately to David Bridge, 8A Ridge Rd., Greenbelt.

Contact Douglas Hackman if you wish to participate in the WINTER BIRD-POPULATION STUDY at Rock Run Sanctuary, Dec. 20--Feb. 10.

Do you have any information on PURPLE MARTINS? J.C. Finlay, 6719 102A Ave., Edmonton, Alberta is studying this species and requests arrival, departure and nesting dates for as many years as possible. He also wants information on population changes, survival of young and results of banding studies. Dr. A.J. Erskine, whom some of you met at the recent AOU meeting, is preparing a monograph on the BUFFLEHEAD and requests arrival and departure dates, peak dates of migration and peak numbers; when writing him at P.O. Box 180, Sackville, N.B., specify whether or not the birds were known to have actually arrived or departed on the dates given. Also report Buffleheads dyed with bright patches of red, yellow, or orange.

Rare birds to watch for this winter (followed by closest area where seen before issue went to press): GOSHAWK (Pa.), HARLEQUIN DUCK (Ocean City), SNOWY OWL (N.Y.), BROWN-CAPPED CHICKADEE (Pa.), BLACK-CAPPED CHICKADEE (Many Md.), BOHEMIAN WAXWING (N.Y.), HOUSE FINCH (Baltimore), PINE GROSEAK (Allegany Co.), COMMON REDPOLL (N.Y.).

JULY, AUGUST, SEPTEMBER, 1961

Chandler S. Robbins

U. S. Weather Bureau records from Friendship International Airport near Baltimore often are used in this column when we wish to correlate weather conditions with bird migration or with nesting activities. But weather records, like bird observations, can be misleading if reports from only a few areas are examined. During the present season, especially in July and August, the Baltimore area received normal or above-normal rainfall while nearly all the rest of the State suffered from moderate deficiencies or serious drought. Reservoir and pond levels were low, and fair to good numbers of shorebirds were seen by observers who checked the flats left by the receding waters. Nesting success of woodland species was normal, judging by the number of immature birds captured at banding stations.

Table 1 shows the earliest fall arrival dates for the more common fall migrant land birds and for a few species of water birds in the counties where coverage was the best. Several of the species in this table are common summer residents in Maryland; fall arrival dates for these species are based largely on records from banding stations, where sudden influxes of birds with deposits of subcutaneous fat provide evidence of migration. The principal contributors to the migration table are: Western Md. (Allegany, Washington and Frederick Counties: bander Pan Minke, also Mrs. Lloyd Mallonee, Mrs. A. L. Hoffman, Dr. Fritz Scheider; Baltimore County and City--banders C. Douglas Hackman, Melvin Garland, Betsy Schaffer, Mrs. Richard D. Cole; Harford County--banders C. Douglas Hackman, Melvin Garland, Mrs. Richard D. Cole; Prince Georges--banders David Bridge, Chandler S. Robbins, Vernon Kleen, Ted Stiles, also Fritz Scheider; Anne Arundel--Mrs. W. L. Henderson, David Bridge; St. Marys--bander Vernon Kleen, also James Banagan; Cecil--bander Vernon Rossman; Kent--banders Mrs. Edward Mendinball and G. L. Gardner, also Mr. Edward Mendinball, Win Ingersoll; Caroline--banders Mr. and Mrs. A. J. Fletcher, also Marvin W. Hewitt, Mrs. Carol Scudder, Mrs. Alicia Knotts, Marguerite Butenschoen; Worcester--Samuel H. Dyke and banders Mrs. Richard D. Cole, C. Douglas Hackman, Chandler S. Robbins, Mrs. Herbert Church, Dr. Bert Haines, Elizabeth Slater, Friel Sanders, A. J. Fletcher, Mrs. Essie Pepper, Dr. Robert K. Burns, Dr. Gordon Meade, Jim Meade, Capt. J. E. M. Wood, Ted Stiles.

Thanks to the efforts of the many active banders in the above list,

Table 1. Fall Arrival Dates, 1961

Operation Recovery stations were in action on either a full-time or part-time basis from 5 to 29 days in August and/or September at the following locations: Towson, Rock Run Sanctuary (116 birds banded), Laurel-Beltsville (231 birds), Greenbelt (220 birds), Patuxent Naval Air Station (74 birds), Chestertown (894 birds), and Ocean City (2,637). The day-to-day changes in the capture records of these banding stations tell a fascinating story of bird migration in relation to weather conditions

and geographic features. A few examples of the Operation Recovery results will be mentioned here. The full story will not unfold until the individual capture records now being entered on punch cards can be studied in detail.

Loons. The Common Loon was one of many species that were late in arriving because of the long spell of hot weather that gripped the East during most of September. The first Common Loon arrived at Remington Farms on Sept. 4 (Clark Webster). The next southward migrants, both singles, were seen on Sept. 24 and Sept. 26 at the Ocean City netting station, followed by 3 and 6 on the last two days of the month.

Frigate-bird, Herons. A new species was added to Maryland's Hypothetical List on Sept. 24, 4 days after Hurricane Esther passed northward, 125 miles off the coast. The storm waif, a male Magnificent Frigate-bird, was seen briefly in pursuit of a Herring Gull over Ocean City's 36th Street flats by Mr. and Mrs. Gibson Davis of Gaithersburg and by Mrs. Mary Pulley and Helen Walker. Mr. Davis and Helen Walker, who identified the bird independently, had seen the species previously in Florida. A Louisiana Heron was seen at Sandy Point State Park on Sept. 10 (Irving Hampe); and a late individual was seen at Ocean City on Sept. 30 (Robbins). A flock of 32 Snowy Egrets at the Ocean City banding station on Sept. 26 was late for this large a number. Five were still at Patuxent Wildlife Research Center near Laurel on Sept. 30 (Patuxent Bird Club).

Swans, Geese and Ducks. A Mute Swan was at Royal Oak, June 11 to Oct. 24 (Jan Reese). A flock of 50 Canada Geese arrived at Remington Farms near Chestertown on Sept. 16 (Clark Webster), and a flock was noted over Allegany County on the same day. On the next day two flocks (25 over White Marsh--Hackman; 28 over Laurel--Robbins) were seen soon after sunrise; at this time a high pressure cell was centered over the eastern Great Lakes and temperatures in that area had dropped to within 10 degrees of the freezing mark. The now famous Fulvous Tree Duck (Maryland Birdlife 17:67-68) remained at West Ocean City throughout the period and was studied at leisure by scores of observers. Early waterfowl arrivals included Blue-winged and Green-winged Teal at Patuxent Wildlife Research Center on Aug. 7 (Francis M. Uhler), Blue-wing on Aug. 10 and Green-wing on Aug. 15 at Remington Farms (Clark Webster), Green-wing at Unity on Aug. 18 (Low) and at West Ocean City on Aug. 20 (Samuel H. Dyke) and 6 White-winged Scoters at Kent Island on Sept. 10 (Terry Moore). A single Oldsquaw summered at Sandy Point (Walter M. Booth and others).

Eagles. We are listing all eagles reported during the period and we urge all observers to continue to report all the eagles they see and to specify the number of adults and immatures. Walter Booth saw an adult Golden Eagle at Browning Pond near Cranesville Bog in Garrett County on Sept. 15. Bald Eagles were seen as follows: 1 adult near Oxford, about Aug. 20 (Charles Mulligan); 1, Garrett County, early September (reported to Booth); 2 adults, White Marsh, Sept. 17 (Hackman); 1 in changing plumage, Rock Run Sanctuary, Aug. 29, and 2 on Sept. 28 (Hackman); 1 ad., Greenbelt, Sept. 16 (Bridge); 1, Sandy Point, Sept. 10 (Baltimore Bird Club); 1 frequently from Sept. 18 on at Gibson Island (Mrs. W. L. Henderson, Mrs. Gail Tappan).

Hawks. The best Broad-winged Hawk flights were observed on Sept. 16, when light northwest winds predominated on the second day after a cold frontal passage: 450 Broad-wings were counted on the 16th at Roth Rock Fire Tower in Garrett County (Booth), 1,288 at White Marsh between 7:05 a.m. and 5 p.m. (Hackman), and 467 at Rocky Gorge Tower between 8:50 a.m. and 3:45 p.m., E.S.T. (Patuxent Bird Club). On the following day the wind shifted to the northeast around 9:30 a.m.; Hackman and the Baltimore Bird Club counted 165 hawks (147 of them Broad-wings) over White Marsh from 7:30 to 9:30, but only 34 hawks (6 Broad-wings) from 9:30 to 5:30 p.m., E.S.T. The last two flights of Broad-wings were witnessed on Sept. 24 (42 at Takoma Park by Booth, 73 at White Marsh by Hackman) and on Sept. 30 (a flock of 18 over Rock Run Sanctuary by Hackman).

Shorebirds, Terns. Terry Moore saw 2 Willets on Reeds Creek near Centerville on the unusual date of June 26. Walter Booth reported Semipalmated Plover at Rocky Gorge Reservoir during September, along with the more regular species: Killdeer, Spotted, Solitary, both yellowlegs, Least, Pectoral and Semipalmated Sandpiper. Single Ruddy Turnstones were at Sandy Point on Sept. 10 (Baltimore Bird Club) and at Gibson Island on Sept. 20-21 (Mrs. Henderson). Terry Moore noted 9 species of shorebirds on Kent Island on Sept. 10; his counts included 50 Greater Yellowlegs, 10 Solitaries, 3 White-rumps and 5 Western Sandpipers. In the Tilghman area on the same day, Jan Reese found 8 species, including 2 Knots. Duvall Jones found a Royal Tern as far up the Bay as Kent Island on Sept. 7.

Woodpeckers. The Red-headed Woodpecker is a regular, but uncommon to rare fall migrant in Maryland. This year, probably because of the acute shortage of acorns in the states to the northeast of us, there have been more reports of migrating birds than contemporary observers can recall. The first bird, an adult, was seen near Leitersburg on Aug. 19, 4 days ahead of the earliest fall migration date on record for Maryland (Mrs. Lloyd L. Mallonee). Five were banded at Ocean City, Sept. 4-29, and one other was seen there. One was at Loch Raven on the Baltimore Bird Club trip on Sept. 16, and 2 flew over White Marsh on the following day (Hackman). For the first time in 6 years, a substantial migration of Downy Woodpeckers was detected at the Ocean City banding station. Totals for the past 4 years, the years with the best coverage, are 2 Downies in 7,248 net-hours in 1958, 10 in 9,638 net-hours in 1959, 7 in 12,052 net-hours in 1960, and 31 in 12,577 net-hours in 1961. The migration was first evident on Sept. 4, and a peak number of 8 was recorded on the 29th. The first Hairy Woodpecker was seen at the Ocean City banding station on Sept. 2. Normally the Hairy does not occur on the barrier beach. The Ocean City banders were astonished to capture 2 Red-bellied Woodpeckers on Sept. 29; although Red-bellies are permanent residents 2 or 3 miles away on the mainland side of Isle of Wight Bay, they have never before been reported from Maryland's barrier beach.

Flycatchers. Eastern Kingbirds were seen regularly along the coast through Sept. 7, although they had departed from most inland locations during August. The last 2 were seen at the Ocean City netting station on Sept. 14; the only later report was of a single individual at Gibson Island on Sept. 23 (Mrs. W. L. Henderson). No Western Kingbird was found

until the last day of September when one was studied by a dozen observers at Ocean City. Another western flycatcher, the Western Wood Pewee, was identified at Ocean City on four September dates (Robbins, Hackman, Meade, Mrs. Cole, Stiles and others); this bird is so similar to the Eastern Wood Pewee that it cannot safely be distinguished in the field except by its song. The identification of 4 Westerns in a total of 19 pewees banded at the Ocean City station suggests that the western bird may occur here in small numbers each year even though it had not been detected east of the Mississippi River states until this fall. Details of this first East Coast record will be published elsewhere. Single Olive-sided Flycatchers were seen at Ocean City on Sept. 6 and Sept. 9 (Hackman) and on Kent Island on Sept. 10 (Terry Moore), and 2 were at Catoctin Mountain on Sept. 4 (Fritz Scheider).

Jays, Ravens. Driven south by a shortage of acorns, Blue Jays staged a heavy flight through Maryland during the latter half of September. The movement reached Maryland quite suddenly on Sept. 16, on which day Hackman saw more than 500 jays over White Marsh; Hackman's highest count was 886 from 7:30 to 9 a.m. on Sept. 24. On the latter date Walter Booth reported 600 over Takoma Park. On the Eastern Shore, where jays normally are comparatively rare, Jan Reese estimated 900 over Tilghman, Sept. 27--Oct. 1. A few strays reached the coast, where they had not previously been witnessed in fall; there were singles at the Ocean City banding station, Sept. 25-27, and a flock of 5 on Sept. 28 (Mrs. Cole and others). A Common Raven was seen from Roth Rock Fire Tower on Sept. 15-16 by Booth.

Nuthatches, Creepers. A heavy southward movement of White-breasted Nuthatches reached Maryland about the same time as the Blue Jay migration. Since this nuthatch breeds in all of Maryland except the Coastal Plain, and since it does not migrate in large flocks by day as does the jay, the influx was best recorded at the banding stations. Red-breasted Nuthatches were conspicuous transients in evergreen woods throughout Maryland during September; 61 were banded at the Ocean City station, Sept. 4-30. In the previous issue we mentioned Miss Schaffer's extraordinary Red-breast dates for Cecil County; the only other arrival date prior to Sept. 2 was Aug. 6, also in Cecil County (Vernon Rossman). A Brown Creeper that arrived in Robbins' breeding population study area at Patuxent Wildlife Research Center just after a brief storm, July 2, was noted regularly through Aug. 5, the last day the area was checked. There was an unusually heavy migration of creepers along the coast during the latter third of September, when 63 were banded at Ocean City. None were recorded west of Chesapeake Bay until Oct. 6!

Vireos. The Warbling Vireo is one of Maryland's rarest fall transients, even though it nests in all except 3 of our counties as well as in all states to the north of us. One banded at Ocean City on Sept. 11 (Hackman, Robbins) is believed to be the first September record for the entire Eastern Shore. The Philadelphia Vireo was not reported in Maryland in the first half of September; 11 were banded at Ocean City, Sept. 16-30, but not one was noted in other parts of the State.

Warblers. Noteworthy early arrival dates included: Black-and-white,

Aug. 2, Cecil County (Rossman); Blue-winged Warbler, July 31, Cecil County (Rossman), and Aug. 5, Patuxent Wildlife Research Center, Anne Arundel County (Bridge, Vernon Kleen, Ted Stiles); Orange-crowned Warbler, 4 banded on Sept. 16 near Chestertown (Mrs. Edward Mendinhall); Myrtle Warbler, 1 banded, Sept. 4 near Chestertown (Mrs. Mendinhall). During the period Aug. 1-9, Vernon Rossman banded an unprecedented total of 13 Worm-eating and 12 Kentucky Warblers, indicating a considerable movement of these two species in Cecil County at that time. Banding totals of 20 Northern Waterthrushes on Sept. 4 and 20 Yellow-breasted Chats on Sept. 29 at Ocean City exceed the highest 1-day fall counts for Maryland. The daily banding totals of the Ocean City and Chestertown Operation Recovery stations demonstrated dramatically the effect of wind direction in concentrating migrants against the Ocean and Bay shorelines. When the wind blew from the northwest or north the migrants occurred in large numbers along the ocean front; conversely, when the wind blew from the east, the concentrations occurred along the eastern edge of Chesapeake Bay. Table 2 shows, for the more common species of warblers, the number banded per 1000 net-hours at Chestertown and at Ocean City on Sept. 6 and 29 (following nights with N to NNE winds) as compared with the number banded per 1000 net-hours on Sept. 7 and 30 (after a shift to ENE or E winds). Totals for the two pairs of dates are combined because some of the figures for a single day are so small.

Table 2. Effect of Wind Direction on Warbler Concentrations

	Wind N or NNE		Wind ENE or E	
	Chestertown	Ocean City	Chestertown	Ocean City
Net-hours	360	938	360	957
Black-and-white	0	17	19	3
Magnolia	0	13	8	7
Blk-throated Blue	6	19	8	4
Blackpoll	0	4	6	6
Ovenbird	8	21	19	6
Northern Waterthrush	0	24	3	11
Yellowthroat	6	17	8	6
Yellow-breasted Chat	3	22	3	4
American Redstart	6	108	3	31

Note that all 9 species were commoner at Ocean City than at Chestertown after northerly winds; that the majority were commoner at Chestertown than at Ocean City after easterly winds; that all but one were commoner at Chestertown after easterly winds than after northerly winds; and that all but one were commoner at Ocean City after northerly winds than after easterly winds. Observers who wish to study migrant land birds on the Coastal Plain of Maryland in fall can benefit greatly by checking local weather conditions and visiting areas where birds seek cover along a peninsula or shoreline.

Tanagers, Finches, Sparrows. Single Summer Tanagers were sighted at Greensboro on Sept. 25 (Hewitt) and Denton on Sept. 27 (Alicia Knotts); the Sept. 27 date is the latest on file for the Eastern Shore. The only Lark Sparrow reported was seen at the Patuxent Naval Air Station, Aug. 1-4 (Vernon Kleen). It is interesting to compare the arrival pattern of two of

our common wintering species, the Purple Finch and the Slate-colored Junco. The Purple Finch was first recorded at Ocean City on Sept. 6 (Robbins), the same day the first one was banded at the Island Beach, N. J., banding station. No other locality reported arrivals until Sept. 16, when migrating birds were noted in Harford, Kent, and Prince Georges Counties and 10 were banded at Ocean City. Early Slate-colored Juncos were banded at Ocean City and Island Beach on Sept. 16, but this species was not seen regularly at coastal locations until Sept. 22 (Island Beach) and Sept. 23 (Cape May and Ocean City). Although as many as 15 were banded at Ocean City on Sept. 29, no other Maryland station reported the junco until Sept. 30, when one was found at Denton (Mrs. Knotts). West of the Chesapeake, arrivals ranged from Oct. 2 to Oct. 15. It is anticipated that techniques for determining the age of juncos will be refined by next fall, so it will be possible to tell whether the early coastal birds are immatures that leave their breeding grounds ahead of the adults and whether the immatures are readily blown off course and so have an entirely different migration pattern from that of the adult birds. Detecting, measuring, and interpreting the differential migration of age and sex groups is a subject of much interest to professional ornithologists at the present time; amateur banders and observers have an opportunity to make significant contributions to these studies.

Patuxent Wildlife Research Center, Laurel

The President's Page (Continued from Page 106)

West of this magnificent range lies the beautiful Flathead Valley, about one hundred miles long and fifteen miles wide.

The elevation of the valley floor is only 3000 feet. It is like a piece of the prairie set in the mountains. The southern end of the valley contains a multitude of glacial potholes, providing superb nesting habitat for waterfowl and shorebirds. The valley contains a number of major areas of particular interest to bird watchers.

In the southwest corner is the 19,000 acre National Bison Range of the U. S. Fish and Wildlife Service. It is primarily an upland area with elevations running from 2600 to 4900 feet above sea level; it serves as a preserve for American bison, elk, mule deer, white-tailed deer, big-horn sheep and antelope. Also in this part of the valley are two national wildlife refuges, Nine-Pipe and Pablo, together comprising 4500 acres of reservoirs, marsh and native grass uplands. Both refuges are surrounded by additional thousands of acres, which have been acquired by the Montana Fish and Game Commission as wildlife management areas and public shooting grounds. Near the Nine-Pipe Refuge is the Kicking Horse Reservoir, also noted for waterfowl and shorebirds. This year Field and Stream listed Nine-pipe and Kicking Horse Reservoirs as two of the 250 hottest bass spots in the country. These reservoirs also abound in rainbow trout.

In the north end of the valley is Flathead Lake, the largest natural body of fresh water, except for the Great Lakes, in the United States. Right in the midst of these fine birding areas, and immediately adjacent to the Nine-Pipe Refuge, is the Allentown Motel with its ex-

cellent restaurant. Allentown is not a community or geographical point--the name comes from the original owner. Allentown Motel is located on U.S. #93 exactly 50 miles north of Missoula and 6 miles south of Ronan.

Since September 8, it has been the pleasure and privilege of my wife and me to live at Allentown. Each unit of the motel has two large picture windows. The east window looks out immediately on a reflecting pool to the 10,000 ft. snow-capped peaks of the Mission Range. The west window looks out across the Nine-Pipe Refuge and southwest to the National Bison Range. The views from these windows are so indescribably beautiful and so frequently changing, because of cloud and sun effects, that we find ourselves constantly walking from one window to the other. From both windows many species of birds can be observed.

Breakfast beside the east window is a time-consuming procedure because we watch Red-necked Grebes, Pied-billed Grebes, and various species of ducks busily rearing and feeding young in the pond. Black and Foster's Terns and gulls course back and forth over the pond. Snipe and Great Blue Herons feed around the margin. Large flocks of Canada Geese can be seen flying back and forth between Kicking Horse Reservoir and Nine-Pipe Refuge. An occasional Bald or Golden Eagle sails over.

At dusk, from the west window, Short-eared Owls may be seen flapping over the Nine-Pipe marshes. Nine-Pipe is an irrigation reservoir. In late summer the drawdown of water exposes the lake bed and vast flats of Eleocharis. Shorebirds of many species are attracted, including small sandpipers, both dowitchers, both yellowlegs, Black-bellied and Golden Plover, and rarities such as Sanderling. As the autumn progresses, thousands of ducks and geese move in for the winter. Large flocks of Snow Geese and some swans stop by.

The valley has a delightful climate the year around. At no season is there such humidity as one finds around Washington and Baltimore. To the visitor who has based his concept of Montana winters upon reports of cold and blizzards in other parts of the state, the valley is unexpectedly and extremely mild. The mountains to the north and east keep the cold winds and snow of the Northern Plains from coming in and also trap here the warmer air coming from the Pacific.

It would take many pages to describe the species of birds, some 200, that may be observed here. The birder who plans a trip to either Glacier or Yellowstone, or both, and does not include a stopoff of at least a few days at Allentown, is missing a most scenic area and a fabulous opportunity for birding. The transcontinental traveler touring either U.S. #2 or #10 can reach this valley by a short side trip. We strongly recommend that any birders planning trips West be sure to visit the Flathead Valley.

Your President plans to return to Maryland in mid-December and will be prepared to give illustrated talks on "The Valley Beyond the Shining Mountains" at chapter meetings.

Seth H. Low

EARLY ARRIVAL OF NESTING RED-HEADED WOODPECKERS

Ann Taylor

As I was leafing through *Birds of Maryland and the District of Columbia*, I noticed that my 1960 arrival date for the Red-headed Woodpeckers (*Melanerpes erythrocephalus*) that breed where Chinquapin Run crosses Woodbourne Avenue, Baltimore, was earlier than the earliest date given, March 31, 1890. The first date I recorded was March 7, 1960, but one bird had been seen several times before that. No birds were noted at any time during the previous fall or winter, but they have been observed by various people at several points along the stream in the springs of the past six or seven years.

One bird was noted at about 8 a.m. on the following days: March 7, 17, 29, April 4, 26, and May 3. Then on May 3 at about 3 p.m. three Red-headed Woodpeckers were noted at the same time. Two were chasing each other and fighting while a third stood by and watched. Two of the birds were again seen on May 13, and one on May 22, May 24, and June 8. On June 9 one bird was tracked to its nest site, where it was observed again on June 10. Because of my absence during the summer no further observations were made of the nesting activity.

1540 Northbourne Road, Baltimore 12

COMING EVENTS

- Jan. 5 HARFORD Film on birdlife and narration by Mr. David Smith.
- Jan. 6 BALTIMORE trip to Loch Raven. Meet 8 a.m. Hutzler's lot, Towson. Leader: Mr. Charles Buchanan.
- Jan. 12 TALBOT Audubon Wildlife film. Mt. Pleasant School, 8 p.m.
- Jan. 12-14 BALTIMORE motor trip to Cape Hatteras. Call Mr. William Corliss - NO8-6047.
- Jan. 13 PATUXENT feeding station trip, 8A Ridge Rd., Greenbelt, 8 a.m.
- Jan. 13 BALTIMORE Jr. walk at Cylburn, 8 a.m.
- Jan. 13-14 BALTIMORE trip to favorite locality. Invite a friend.
- Jan. 14 SOLDIER'S DELIGHT winter bird walk. Meet at Distillery on Bonita Avenue.
- Jan. 17 ALLEGANY monthly meeting. "A Guide to the Best Nature and Conservation Books," presented by Mr. Ken Hodgdon.
- Jan. 19 BALTIMORE monthly meeting. 8 p.m. Lecture by Ralph Lawrence.
- Jan. 19 TALBOT monthly meeting. 8 p.m. Eastern Library. Mr. Banko

- Jan. 21 BALTIMORE trip to Patuxent Refuge. Meet 8 a.m. Montgomery Wards Parking Lot. Leader: Mr. Malcolm Thomas.
- Jan. 27 ANNE ARUNDEL bird walk. Davidsonville, Road, Gambrills, Md.
- Jan. 27 BALTIMORE Jr. walk at Cylburn, 8 a.m.
- Jan. 27 PATUXENT trip, to Patuxent Refuge. 8-12. Meet at main gate.
- Jan. 28 BALTIMORE covered dish supper. Meet Lake & Roland Aves. 2:30 p.m. for bird walk. Phone HO7-0676.
- Feb. 1 PATUXENT stargazing trip, 314 Bond Mill rd. 7:30 p.m. Getchell.
- Feb. 3 BALTIMORE beginners walk at Cylburn. Meet 8 a.m. B. Schaffer.
- Feb. 3 SOLDIER'S DELIGHT trip to Carroll County. 9 a.m. Meet at Forest Inn on Westminster Pike.
- Feb. 4 BALTIMORE trip to Druid Hill Park Waterfowl Lake. Meet at Mansion House 2:30 p.m. Leader: Mr. Ernest Adams.
- Feb. 10 ANNE ARUNDEL business meeting. 8 p.m. at Valley Park Farm in Edgewater. Program: Phases of Ecology.
- Feb. 10 BALTIMORE Jr. trip to Cylburn. 8 a.m.
- Feb. 10 PATUXENT trip 8-12 for best birds in area. Call PA5-1176.
- Feb. 16 TALBOT monthly meeting. Easton, Library, 8 p.m.
- Feb. 17 PATUXENT trip to Sandy Pt. 8:15-12. Meet lith & Montg'y, 7:30
- Feb. 18 TALBOT trip to Ocean City. Meet Easton Library 8 a.m.
- Feb. 21 ALLEGANY monthly meeting. Film: "George Washington's River." Discussion leader: Miss Nan Livingston.
- Feb. 21 TALBOT Audubon Wildlife Film. Mt. Pleasant School, 8 p.m.
- Feb. 24 ANNE ARUNDEL early bird walk. Meet at 101 Old Crossing Lane. Leader: Capt. & Mrs. J.E.M. Wood, CO3-3229.
- Feb. 24 BALTIMORE Jr. walk at Cylburn. Meet 8 a.m.
- Feb. 25 BALTIMORE banding demonstration. Mrs. Cole's 9-12 a.m.
- Feb. 27 PATUXENT monthly meeting, Laurel City Hall, 7:45 p.m. "The Valley Beyond the Shining Mountains" by Seth H. Low.
- Mar. 2 HARFORD monthly meeting. Members report on 1961-62 vacations illustrated with slides and movies.
- Mar. 4 BALTIMORE trip to Brigantine Nat'l Wildlife Refuge. Meet Edgewood Diner, 6:30 a.m. Mr. & Mrs. Malcolm Thomas.
- Mar. 5 SOLDIER'S DELIGHT meeting at Worthley's, 8:30 p.m. Talk on spring flowers by Mrs. Schaffer.
- Mar. 10 BALTIMORE Jr. walk to Cylburn. Meet 8 a.m.
- Mar. 10 BALTIMORE trip to Woodstock. Meet northeast side Gwan Oak Jct. 7:30 a.m. Percy Jones.
- Mar. 10 PATUXENT duck trip to local lakes. Meet Patux, main gate 7:30
- Mar. 15 TALBOT Audubon Wildlife Film. Mt. Pleasant School, 8 p.m.
- Mar. 16 BALTIMORE monthly meeting. Paid lecture by Dr. Arthur Twomey.
- Mar. 18 BALTIMORE trip to Aberdeen Proving Grounds. Meet Edgewood Diner 8 a.m. Leader: Douglas Hackman.
- May 5 Statewide Bird Count.
- May 11-13 ANNUAL CONVENTION, Hastings Hotel, Ocean City.

MARYLAND BIRDLIFE

Published Quarterly by the Maryland Ornithological Society, Inc.
to Record and Encourage and Study the Birds in Maryland

Editor: Chandler S. Robbins, Patuxent Research Center, Laurel
 Editorial Board: C. Douglas Hackman, Vernon Kleen, Miss Nan Livingstone,
 Mrs. Helen Webster, Mrs. Jean Worthley.
