

## The 2004-2005 Christmas Bird Counts

Ned Keller

7899 Bridgetown Rd., Cleves, OH 45002

keller@one.net

The results from 64 Christmas counts are included in this year's report, well above last year's unusually low 54. In addition to the counts on the Audubon web site (see [www.audubon.org/bird/cbc/](http://www.audubon.org/bird/cbc/)), we present the results from six additional counts: Carey, Clark County, Fremont, Gypsum, Hancock County, and Lakewood. Despite the increased effort, we found only 150 species, one less than last year's 151. At any rate, we have followed our usual practice of including the results as they were reported to us, without attempting to verify reports of rarities.

Twenty-one species were recorded from only a single count: a long-tailed duck and a northern goshawk at Lake Erie Islands, a red-necked grebe, a Thayer's gull, an Iceland gull and two glaucous gulls at Grand Rapids-Waterville, an osprey in Clark County, a Virginia rail at Millersburg, a dunlin at Ashtabula (plus another count week at Brown Family Environmental Center), an American woodcock at East Fork S.P., three snowy owls and a Lincoln's sparrow in Toledo, two long-eared owls at Ottawa N.W.R., a loggerhead shrike at Indian Lake (plus another count week at Kingston), a house wren and a pine warbler at Cuyahoga Falls, six marsh wrens at Elyria-Lorain (this may have been a data entry error, as they reported no winter wrens.), a Cape May warbler and a palm warbler at Wilmot, a Wilson's warbler at Hamilton-Fairfield, and a Henslow's sparrow in Adams County. Unusually, no species were added to the season's state list during count week.

Birders on the Cincinnati count ignored a near-record December snowfall to find 92 species, followed by Cuyahoga Falls with 86, Fremont and Gypsum with 84, Millersburg with 83 and Adams County with 80. Cuyahoga Falls had the most birders in the field and at feeders with 96, followed by Wilmot with 76 and Millersburg with 75.

The numbered circles on the map correspond to the numbers in parentheses that follow the names of the counts in the tabular report.

Golden-crowned kinglet by Bill Shively

## Herring Gulls *Larus argentatus* breed successfully in Southeastern Ohio

Wendell L. Argabrite\*, Michael Griffith,  
Dr. Gary O. Rankin, Harry E. Slack, III

In North America, herring gulls *Larus argentatus* breed from arctic Canada into eastern Alaska, northern Minnesota, northern Wisconsin, northern Ohio, northern New York, northeastern Illinois, northeastern Indiana, southeastern Wyoming and along the Atlantic Coast south to northeastern South Carolina (A.O.U. 1998, Pierotti and Good 1994). Isolated breeding in North America has occurred in southern Alabama, southern Louisiana, and southern Texas (A.O.U. 1998).

In Ohio, herring gulls nest primarily along western Lake Erie (Peterjohn and Rice 1991). About thirty pairs have been noted nesting inland in northeastern counties since 1991 (Peterjohn 2001). South of the aforementioned sites, nesting attempts have been documented in four counties: Gallia (Kyger Creek Power Plant) in 1971 (Kiff et al. 1986); Portage (Lake Rockwell) and Trumbull (Mosquito Creek Reservoir) from 1982 to 1987 (Peterjohn and Rice 1991); and Mercer (Lake St. Marys) in 1985 (Peterjohn and Rice 1991). Here, we report successful breeding by herring gulls in southeastern Ohio's Gallia County in 2004.

Herring gulls are casual summer visitants in the lower Ohio River valley bordered by Ohio and West Virginia ([www.birdsofthelowerohiorivervalleyinwestvirginia.com](http://www.birdsofthelowerohiorivervalleyinwestvirginia.com)). On 5 June 2004, during a survey of ponds at General James M. Gavin Power Plant, five adult and eight juvenile Herring Gulls were recorded. The gulls were on a spoil area of a bottom ash pond with sufficient vegetation to provide cover for juvenal birds. The juveniles were estimated to be about six to eight days old.

Four additional visits in June recorded eight or nine juveniles and three to eight adults. Eight juveniles found on 16 July appeared capable of sustained flight. On 22 July sustained flight was confirmed for nine juveniles. A tenth juvenile on the spoil area appeared sick or injured. Thereafter, only single juveniles were recorded on 1 and 8 August and 28 September. From one to six adults were present from July to September.

Based on breeding parameters (Pierotti and Good 1994) egg-laying would have begun about 29 April to 1 May. Fledging occurs 45 to 50 days after hatching, which corresponds to our observations of fledging between 16 and 22 July. Three or four pairs of adults likely nested based on the modal clutch of 3 eggs.

### Acknowledgments

We thank officials of American Electric Power, especially Don Anderson and Doug Workman, for permission to conduct surveys at General James M. Gavin Power Plant. Roy S. Slack made helpful comments on a previous draft.
