

4. *Centurus blakei*, sp. nov.

SP. CHAR.—Similar to *C. nycanus* but much darker, the forehead pale drab, or light grayish-buff (instead of pure white); auriculars deep light drab, fore-neck and chest olivaceous-drab, and lighter bars of back, scapulars and rump, light dingy buff instead of nearly pure white; frontlet dull orange-red (instead of pure vermilion, or scarlet).

Adult male (type No. 108,618, Abaco I., Bahamas, April 2, 1886; Charles H. Townsend): Wing, 5.35; tail, 3.90; culmen, 1.45; tarsus, .90.

Adult female (type No. 198,619, same locality, April 6, 1886; Willard Nye): Similar to the male, but crown and occiput ash-gray, becoming gradually lighter anteriorly, the hinder portion (connecting superciliary spots) spotted with black; frontlet merely tinged with orange, and grayish of lower parts, as well as white bars of back, etc., much less strongly tinged with yellowish. Wing, 5.25; tail, 3.80; culmen, 1.35; tarsus, .85.

Eleven adult males, six adult females.

This new species is dedicated to his Excellency, Governor Henry A. Blake, to whom the naturalists accompanying the 'Albatross' are indebted for many courtesies and kind attentions.

THE BIRDS OF THE WEST INDIES, INCLUDING
THE BAHAMA ISLANDS, THE GREATER AND
THE LESSER ANTILLES, EXCEPTING
THE ISLANDS OF TOBAGO
AND TRINIDAD.

BY CHARLES B. CORY.

[Continued from p. 245.]

SP. CHAR. *Male*.—Top of the head black, shading into dark brown, with a blackish gloss on the back; throat, breast and belly smoke-color; a faint tinge of rufous on the flanks; wings and tail dark brown, almost black; tertials and some of the wing-coverts heavily marked with white, forming a partially concealed white patch at the junction of the wing and back.

Female.—Top of the head dark brown; a malar stripe of light brown; throat brownish white, rest of underparts dull white; crissum brownish olive; back and rump dark slate-color; wings and tail brown, pale rufous on the inner webs of the primaries; outer webs of secondaries, and some of the inner primaries, showing dull rufous brown.

Length (skin), 7.20; wing, 4; tail, 3.50; tarsus, .85; bill, .55.

HABITAT. Jamaica.

FAMILY CAPRIMULGIDÆ.

GENUS *Nyctibius* VIEILL.

Nyctibius VIEILLOT, Analyse, p. 38 (1806).

Nyctibius jamaicensis (GMEL.).

Caprimulgus jamaicensis GMEL. Syst. Nat. I, p. 1029 (1788).—DENNY, P. Z. S. 1847, p. 38.

Sci. Phila. 1863, p. 286.—GRAY, Handl. Bds. I, p. 56 (1869).—SCL. & SALV. Nom. Avium Neotr. p. 95 (1873).—A. & E. NEWTON, Handb. Jamaica, p. 108 (1881).—CORY, List Bds. W. I. p. 16 (1885).

SP. CHAR. *Male*.—General plumage grayish, heavily marked, streaked, and blotched with brown and white; some of the feathers sparsely

tinged with pale rufous on the back, wing-coverts, and underparts; throat dull white, the shafts of the feathers brown, giving the throat the appearance of being streaked with narrow lines of brown; these lines are broader on the shafts of the feathers on the belly, many of the feathers being tipped with brown, and showing the pale rufous edging before mentioned; wings and tail brown, imperfectly banded with pale markings; upper surface of tail showing imperfect white bands; under surface of tail thickly mottled with dull white; under surface of wings brown, with white dots.

Length (skin), 16; wing, 12; tail, 8.50; culmen, 1.

HABITAT. Jamaica.

Nyctibius pallidus GOSSE.

Nyctibius pallidus GOSSE, Bds. Jam. p. 49 (1847).—BP. Consp. I, p. 58 (1850).—ALBRECHT, J. f. O, 1862, p. 199.—MARCH, Pr. Acad. Nat. Sci. Phila. 1863, p. 286.—SCL. P. Z. S. 1866, p. 129 (?).—GRAY, Handl. Bds. I, p. 56 (1869).—A. & E. NEWTON, Handb. Jamaica, p. 108 (1881).—CORY, List Bds. W. I. p. 16 (1885).

“Length 11 inches, expanse 22, rictus $1\frac{1}{8}$, beak from feathers to tip $\frac{3}{8}$, flexure, 6, tail $3\frac{1}{4}$.

“The nostrils prominent, tubulated, and covered with a membrane; from the nostrils runs a deep groove or furrow towards the tip. The beak was bent like the end of an Owl’s, and when closed was longer than the under mandible; the latter was of a subulated form, shorter and bending in a contrary direction to the upper one: it was broader than the upper; its margins were inverted, and received the upper one exactly, when closed. There were no bristles on the angle of the mouth. The tibiæ (tarsi?) or shank-bones are shortened into a heel, so that the measure of what is usually called the leg, from the bend of the knee to the first joint of the middle toe, is only 2-8 of an inch. The length of that part which ought to be called the leg, (tibia?) is $1\frac{1}{2}$ inch, and the bone of the thigh 1 inch. Toes four, three before, one behind; covered with ash-coloured scales, very flat beneath, and all connected by narrow membrane. Claws brown, strong, gently curved, and compressed; middle claw thinned to an edge on the inner side, but not serrate. Tail of ten feathers, equal, broad, rounded, barred with blackish and grey, and these bars again marked with less black bars. Wing quills coloured chiefly like the tail, but deeper; secondaries edged with clay-colour; winglet and long coverts immediately beneath it, black, with a few whitish bars; greater coverts black, edged with clay-colour; the next row of coverts whitish, with black shafts; the next row black, making a large triangular black spot in the expanded wing. Eyes very large, irides bright yellow. Head, neck, and throat, white, with black shafts; above each eye some black and white streaked feathers in an erect position, forming two small

roundish rings. On the breast, clay-coloured feathers with black shafts and black spots. Sides, belly, and vent, white with black shafts. A line of black feathers down the middle of the back; rump ashy, with narrow black shafts. On shoulders a mixture of ash and clay-colour, with black shafts. Plumage very loose. Weight, 3 oz., 7 sc." (GOSSE, from Robinson's MSS., Bds. Jam. pp. 49, 50. 1847.)

HABITAT. Jamaica.

This is a very doubtful species, not generally recognized by authors. Probably the same as *N. jamaicensis*.

GENUS *Chordeiles* SWAINS.

Chordeiles SWAINSON, Fauna Bor. Amer. II, p. 496 (1831).

Chordeiles minor CAB.

Chordeiles minor CAB. J. f. O. 1856, p. 5.—SCL. Cat. Am. Bds. p. 279 (1862).—ALBRECHT, J. f. O. 1862, p. 199.—MARCH, Pr. Acad. Nat. Sci. Phila. 1863, p. 286.—SCL. & SALV. Nom. Chordeiles popetue BRYANT, Pr. Bost. Soc. Nat. Hist. VII, p. 108 (1859).—GUNDL. Repert. Fisico-Nat. Cuba, I, p. 282 (1865); *ib.* J. f. O. 1874, p. 117.

Chordeiles gundlachi BREWER, Pr. Bost. Soc. Nat. Hist. VII, p. 306 (1860).

Chordeiles popetue var. *minor* BD. BWR. & RIDGW. Hist. N. Am. Bds. II, p. 400 (1874).

SP. CHAR. *Male*.—Above dark brown, variegated with white and tawny; underparts tawny, banded with brown; throat tawny, becoming whitish on the breast; a white line from sides of throat to chin; first two primaries with a spot on the inner web, and the second and third with a band of white; edge of carpus white.

The female differs from the male by having the sides of the throat rufous instead of white.

Length, 8.25; wing, 7; tail, 4; tarsus, .50; bill, .20.

HABITAT. Antilles.

Chordeiles virginianus (BRISS.).

Caprimulgus virginianus BRISSON, Orn. p. 477 (1760).—GMEL. Syst. Nat. I, ii, 1028 (1788).

- Chordeiles virginianus* GOSSE, Bds. Jam. p. 33 (1847).—LEMB. Aves Cuba, p. 51 (1850) (?).—SUNDEV. Oefv. K. Vet. Akad. For. 1869, p. 600 (?).
—CORY, List Bds. W. I. p. 16 (1885).
- Chordeiles popetue* var. *popetue* BD. BWR. & RIDGW. Hist. N. Am. Bds. II, p. 401 (1874) (Greater Antilles).

I have never seen a specimen of *C. virginianus* from the West Indies; several authors have recorded it, but it is possible that they may have mistaken *C. minor* for this species.

GENUS *Antrostomus* GOULD.

Antrostomus "GOULD, Icones Avium, 1838."

Antrostomus rufus (BODD.).

- Caprimulgus rufus* "BODD. et GMEL. ex Pl. Enl. p. 735."

W. I. p. 16 (1885).
- Antrostomus rutilus* BURM. Syst. Ueb. II, p. 385.—ALLEN, Bull. Nutt. Orn. Club, V, p. 169 (1880).

SP. CHAR.—Upper surface mottled and varied with brown and black; the terminal portions of the feathers on the head with broad patches of black in the centre of the feathers; underparts darkening on the breast, but becoming heavily tinged with rufous on the abdomen and crissum; primaries broadly blotched with light rufous, heaviest on the outer webs; a large blotch of white on the terminal portion of the inner web of the outer tail-feather, showing upon both webs of the second and third feathers; central tail-feathers dark brown, heavily mottled with rufous; feet black. In general appearance the bird is smaller and much darker than *A. carolinensis*.

Length, 10.50; wing, 7.50; tail, 5; tarsus, .60.

Recorded from Santa Lucia, W. I.

Antrostomus carolinensis (GMEL.).

Antrostomus macromystax var. *cubanensis* BD. BWR. & RIDGW. Hist. N. Am. Bds. II, p. 409 (1874).

“*Adult male*.—Upper plumage dark ash, minutely mottled with dull rufous and grey, the feathers conspicuously marked with longitudinal stripes of black in their centres; a line extends from the bill over the eye and along the crown of greyish white, tinged with pale rufous and intermixed with black; the tertiaries ochraceous-white, beautifully variegated with black, and having near the end of each feather an irregular patch of velvety black; wing-coverts the same color as the back, some of them marked near their ends with ochraceous spots; primaries dark reddish-brown sprinkled with dull rufous and grey at their ends, and having bright rufous spots arranged regularly on their outer webs, there are spots also on their inner webs, more obscure in color and assuming a mottled form; secondaries dark brown, mottled with grey on the outer webs, and tinged with rufous on the inner; tail very full, of a fine deep brown, the two central tail-feathers closely banded with curving bars of mottled grey and pale rufous, the next feather on each side, with the bars dull rufous, and rather narrowly tipped with ochraceous-white, less in extent on the inner web, the three outer feathers are irregularly barred with dull rufous mottling for their basal half, their ends for about an inch creamy-white, with ochraceous edges; throat dark brown, minutely freckled with rufous, the neck immediately below this color crossed with a band of pale rufous; a line of pale rufous-white or ochraceous spots extend along below the under mandible, and down the side of the neck, a few spots of the same in a line below the eye; on the side of the neck enclosed by these spots and the band across the throat,

is a triangular blackish-brown patch, speckled with rufous; sides of the head brown, freckled with minute rufous spots; feathers of the breast and abdomen ochraceous white, more or less tinged with rufous, and having their centres dark brown, and their sides and ends barred and mottled with the same color; the exposed ends of the feathers being but little mottled give quite a light appearance to the under plumage; lower part of the abdomen and under tail-coverts dull pale rufous, the feathers of the latter with dark markings along their shafts; sides under the wings dull rufous narrowly barred with dark brown; under wing-coverts brown mottled with rufous; tarsi clothed in front with rufous brown feathers; the bill is light brown, black at the point, and having very strong bristles, some of which are nearly two inches in length, and furnished with lateral filaments; feet brown. Length about $11\frac{1}{2}$ inches; wing $7\frac{1}{2}$; tail $5\frac{3}{4}$; tarsus $\frac{1}{2}$." (LAWR. l. c. orig. descr.)

HABITAT. Cuba.

Avium Neotr. p. 96 (1873) (Martinique).—CORY, List Bds. W. I. p.

16 (1885).

SP. CHAR. *Male*.—Upper surface a mixture of gray, rufous, dark brown, and white, the feathers mottled and edged with the different colors; the two central tail-feathers gray, curiously marked with dark brown, rest of the tail-feathers white, edged with brown on the outer webs, and banded near the centre, the brown lacking on the outer web of the outer feather; under surface of tail-feathers white, showing a band of brown across the centre; throat and abdomen white; breast heavily mottled with rufous; wings dark brown, the coverts mottled with rufous and blotches of white; a heavy band of white crossing the middle of the primaries.

Female.—Entirely lacks the white markings on the wings and tail; the general plumage is dull brown, variously marked with

brown and rufous; the under surface being dull rufous, narrowly banded with brown; wings and tail brown, marked with rufous.

Length (skin), 8.75; wing, 5.50; tail, 4.50; tarsus, 60.

It is claimed that this species occurs in the Lesser Antilles. A specimen in my collection is labelled "Trinidad," and Messrs. Sclater and Salvin give it from Martinique.

SP. CHAR. *Male*:—Above green, showing slight golden reflections on the back, with the tips of the feathers, in some specimens, bluish; head darker; throat beautiful purple-violet, below which is a band of white; underparts green, mixed with rufous, shading into white on the flanks; crissum pale rufous white; wings brownish purple; tail appearing black, very dark purple in some lights; outer feathers with faint terminal spot of rufous, second with inner web, and third with inner and basal half of outer web cinnamon; bill and feet black.

Female:—Purple gorget wanting and replaced by dull white, with a slight tinge of rufous; upper parts paler than in the male; sides cinnamon, becoming brightest under the wings; central feathers of the tail bright green, the rest cinnamon; an oblique purplish band on the tips of the fourth feathers.

Length, 3.40; wing, 1.70; tail, 1.40; tarsus, .15; bill, .70.

HABITAT. Bahamas.

Doricha lyrura GOULD.

Doricha lyrura GOULD, Ann. Mag. Nat. Hist. 4th ser. IV, pp. 111, 112 (1869).—ELLIOT, Ibis, 1872, p. 354.—SCI. & SALV. Nom. Avium

SP. CHAR. *Male*:—General appearance the same as *D. evelynæ*, but differs from it by showing the beautiful purple-violet on the forehead as well as on the throat, and also having a much longer tail, formed somewhat in the shape of a lyre, from which this bird has derived its name. The throat of *D. lyrura* shows bright blue in some lights on the lower part, while that of *D. evelynæ* is almost entirely purple-violet, showing the bluish tinge very slightly if at all.

Female:—Upper parts brownish-green; throat and upper breast dull white; rest of underparts pale rufous brown; central tail-feathers green, rest of tail-feathers pale rufous, showing a black band in the centre.

Length, 3.64; wing, 1.60; tail, 1.58; tarsus, .13; bill, .60.

HABITAT. Inagua and Long Island.

Coccyzus merlini SCHLEG. Mas. Pays-Bas, I, p. 40 (1864).

SP. CHAR.—Very large. The head and back brown, with a tinge of olive, brightest on the head and rump; throat dull ashy white, shading distinctly ashy on the breast; rest of underparts pale chestnut brown; under surface of wings rufous; pale chestnut on the under coverts; primaries dark chestnut rufous, tipped with olive, showing slight metallic reflections; wing-coverts pale olive; two central tail-feathers dull olive, showing a brownish tinge on basal portions; rest of tail-feathers dull olive, showing a brownish tinge slightly on the inner webs, and having a subterminal band of black, tipped with white.

Length, 21; wing, 7.25; tail, 12; tarsus, 1.50; bill, 2.

HABITAT. Cuba.

Saurothera bahamensis BRYANT.

Saurothera vetula BRYANT, Pr. Bost. Soc. Nat. Hist. VII, p. 106 (1859).

Saurothera bahamensis BRYANT, Pr. Bost. Soc. Nat. Hist. IX, p. 280 (1864).—CORY, Bds. Bahama I. p. 116 (1880); *ib.* List Bds. W. I. p. 18 (1885).

SP. CHAR. *Male*:—Above pale olive, showing slight greenish reflections; throat and breast dull grayish white; belly and crissum tawny; primaries mostly rufous; tail-feathers, except the two central ones, tipped with pale brownish white; legs slaty blue; soles of the feet yellow; eyelids vermilion red; upper mandible brownish, shading into slate color at the base; iris brown.

The sexes are similar.

Length, 18; wings, 6.25; tail, 9.50; tarsus, 1.50; bill, 1.80.

HABITAT. Bahamas.

GENUS *Coccyzus* VIEILL.

Coccyzus VIEILLOT, Analyse, p. 28, 1816.

Coccyzus americanus (LINN.).

Cuculus americanus LINN. Syst. Nat. I, p. 170 (1766).

Coccygus pluvialis SCHLEG. Mus. Pays-Bas. I, p. 39 (1864).

Hyetornis pluvianus GRAY, Handl. Bds. II, p. 212 (1870).

Sp. CHAR.—Top of the head smoky brown; rest of the upper surface olive; throat dull white showing a tinge of chestnut; rest of underparts dark chestnut brown; under wing-coverts rufous chestnut; primaries dull olive brown, with a slight metallic tinge of green on the inner webs of the primaries and distinctly perceptible on the secondaries; tail dull black, showing a slight purplish tinge; all of the tail-feathers tipped with white.

The sexes are similar.

Length, 18; wing, 7; tail 10; tarsus, 1.60; bill, 1.25.

HABITAT. Jamaica.

Bucco cayennensis Sallé (P. Z. S. 1857, p. 234), from San Domingo, it is impossible to identify, as Sallé gives no description, and the genus does not occur in the West Indies.

FAMILY ALCEDINIDÆ.

GENUS *Ceryle* BOIE.

Ceryle BOIE, Isis, 1828, p. 316.

Ceryle stictipennis LAWR.

Ceryle torquata LAWR. Pr. U. S. Nat. Mus. I, pp. 459, 487 (1878).—CORY, List Bds. W. I. p. 19 (1885).

Ceryle stictipennis LAWR. Pr. U. S. Nat. Mus. VIII, p. 623 (1885).

“*Male*.—The upper plumage is ashy-blue, with a broad, pure white band across the hind neck, connecting with the white of the throat; lores black; a spot of white anterior to the eye, and another of the same color below it; the upper tail-coverts are colored like the back, and are barred on both webs with white; the two middle tail feathers are also colored like the back; the shafts are black, bordered narrowly on each side with deep black; they are conspicuously marked with triangular-shaped white spots on the middle of each web, these are nine in number on each side; the other tail feathers are black, with their outer edges colored like the back, and having pure white spots rounded in form on each web, those on the inner webs are much the largest; all the tail feathers are tipped with white; the quills are black, largely white on their inner webs and marked on the primaries with quadrate white spots on the outer ones, rather far apart; the secondaries have also small white spots on their outer webs, and on the inner webs large round spots, the outer webs are margined with ashy-blue; the tertiaries are largely ashy-blue on their outer webs, spotted and barred with white, the inner webs are brownish-black and marked with large spots of white; the wing-coverts are like the back in color, the larger ones are sparsely marked with small white spots; the scapulars are narrowly barred with white; the under wing-coverts are white, largely intermixed with cinnamon color; the throat is white; the lower part of the neck, the breast, and the abdomen are of a very dark cinnamon color; the lower part of the abdomen, the flanks, crissum and under tail-coverts are white, closely spotted and barred with rather dull ashy-blue; the tarsi and toes are dark brown; the bill is black, with the basal half of the under mandible yellow.

“Length, fresh, 17 inches; wing, 7 $\frac{1}{4}$; tail, 5 $\frac{1}{2}$; bill, 3.

“*Habitat*.—Guadeloupe, West Indies. Type in my collection.

“*Female*.—The color above is similar to that of the male, but it has the entire back and wings marked sparsely with small white spots; in the markings on the head, wings, and tail they are much alike; it has the white throat and band on the hind neck as in the male; across the lower part of the throat and upper part of the breast there is a broad band of ashy-blue, minutely freckled with white; this band is bordered narrowly below with white; the entire under plumage besides, and the under wing-coverts are deep cinnamon.

“Length (skin), $17\frac{1}{2}$ inches; wing, 8; tail, $5\frac{1}{4}$; bill, 3.

“The type of the female is in the National Museum, Washington, to which it was sent from Guadeloupe by Mr. L. Guesde.” (LAWR., l. c., orig. descr.)

It has always been supposed that *Ceryle torquata* did not differ from the Guadeloupe species, but Mr. Lawrence considers the West Indian bird as new and has described it as above. The greatest difference seems to be the white spotting of the wings and back, and the rufous marking of the under wing-coverts. Were it not for the isolated position where it occurs it would represent a variety of *C. torquata*, but as we have no record of its occurrence elsewhere in the West Indies, and as it is claimed to be resident in Guadeloupe, intergradation seems hardly probable, still the Lesser Antilles are not, as yet, so well known as to justify us in saying *C. torquata* does not occur elsewhere in the West Indies.

FAMILY TODIDÆ.

GENUS *Todus* LINN.

Todus BRISSON, Orn. IV, p. 528 (1760).—LINNÆUS, Syst. Nat. I, p. 198 (1766).

Todus viridis LINN.

Todus viridis LINN. Syst. Nat. I, p. 178 (1766).—GOSSE, Bds. Jam. p. 72 (1847).—DENNEY, P. Z. S. 1847, p. 38.—BP. Consp. I, p. 182 (1850).—ALBRECHT, J. f. O. 1862, p. 199.—SCL. Cat. Am. Bds. p. 263 (1862).—SCL. & SALV. Nom. Avium Neotr. p. 103 (1873).—SHARPE, Ibis, 1874, p. 349.—A. & E. NEWTON, Handb. Jamaica, p. 109 (1881).—CORY, List Bds. W. I. p. 19 (1885).

SP. CHAR.—Entire upper surface bright grass-green; throat bright red, the feathers showing delicate tipplings of white when held in the light; a narrow stripe of white on each side of the throat, becoming grayish as it reaches the breast; breast dull white, strongly tinged with green; belly very pale yellow; a patch of pink on the sides of the body; primaries dark brown, narrowly edged with green; the inner primaries and secondaries having nearly the entire outer web green; under surface of tail brownish; upper surface of tail green.

The sexes are similar.

Length, 4.60; wing, 1.80; tail, 1.40; tarsus, .45; bill, .62.

HABITAT. Jamaica.

Todus angustirostris LAFR.

Todus angustirostris LAFR. Rev. Zool. 1851, p. 478.—SALLÉ, P. Z. S. 1857, p. 233.—BRYANT, Pr. Bost. Soc. Nat. Hist. XI, p. 91 (1866).—SHARPE, Ibis, 1874, p. 352.—CORY, Bds. Haiti & San Domingo, p. 107 (1885); *ib.* List Bds. W. I. p. 19 (1885).

SP. CHAR. *Male*.—Above bright green; throat dark crimson; the feathers slightly touched with white; underparts white; flanks pinkish; under wing- and tail-coverts pale yellow; a line of white extending from the base of the mandible, separating the colors of the head and throat, becoming grayish as it reaches the sides of the neck; entire upper mandible and terminal half of lower mandible dark brown; legs black.

The sexes are similar.

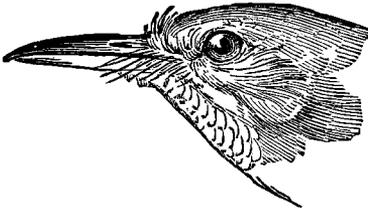

Length, 4; wing, 1.90; tail, 1.50; tarsus, .45; bill, .60; width of bill at middle, .12.

HABITAT. San Domingo.

Todus subulatus GOULD.

Le Todier de St. Dominique, "BUFF. Pl. Enl. p. 585, figs. 1, 2 (1783)."

Todus viridis "VIEILL. Nouv. Dict. XXXIV, p. 184, pl. 29, fig. 4 (1819)."

Domingo, p. 105 (1885); *ib.* List Bds. W. I. p. 19 (1885).

Todus dominicensis LAFR. Rev. Zool. 1847, p. 331.—SALLÉ, P. Z. S. 1857, p. 233.—BRYANT, Pr. Bost. Soc. Nat. Hist. XI, p. 91 (1866).—SCL. & SALV. Nom. Avium Neotr. p. 103 (1873).—CORY, Bull. Nutt. Orn. Club, VI, p. 154 (1881).

SP. CHAR. *Male*.—Above bright green; throat crimson red, the feathers faintly tipped with white; underparts dull yellowish, the feathers edged with pale red on the basal portions, the color only slightly showing on the surface, and giving the chest and belly the appearance of being pale yellowish, faintly streaked with red; flanks pale pinkish red; wings dark brown, edged with green; tail green; crimson and under tail-coverts pale yellow; a line of dull white extending from the base of the mandible, separating the green of the head from the red of the throat; upper mandible dark brown; the tip of lower mandible dull brown.

The sexes are similar.

Length, 4.35; wing, 2.05; tail, 1.60; tarsus, .60; bill, .70; width of bill at middle, .20.

HABITAT. Haiti and San Domingo.

Todus pulcherrimus SHARPE.

Todus pulcherrimus SHARPE, Ibis, 1874, p. 353; pl. xiii, f. 3.—CORY, List Bds. W. I. p. 19 (1885).

“Above bluish-green, rather tinged with olive on the lower back, the wing-coverts showing a very strongly pronounced blue shade; quills blackish, bordered narrowly with light green, shading off into bluish towards the tips of the secondaries; tail dull greenish, with narrow margins of bluish green; forehead lighter and rather more olive-green than the back, and tinged with orange near the base of the beak; lores tinged with orange; sides of face yellowish green; sides of neck dull rufous; chin white; throat bright carmine, with silvery white margins to most of the feathers; rest of under surface with a light crimson blush, varied on the breast with white oval spots to the feathers, producing an ocellated appearance, the crimson colour brightest on the flanks, shading off into ochraceous buff on the sides of the vent; on each side of the upper breast a patch of greenish; under wing-coverts ochraceous buff, the outermost smaller coverts washed with pale carmine; upper mandible blackish, lower one yellowish; feet black.

“Total length, 3.5 inches; culmen, 0.85; wing, 1.9; tail, 1.4; tarsus, 0.65.

“HAB. Jamaica?”

“This new species comes nearest to *T. subulatus* of S. Domingo, having, like that species, the white ocellations on the breast; but it differs from that bird and all other members of the genus by its brilliant coloration below, and by its being bluish green above.

“The type is in the British Museum.” (SHARPE, l. c., orig. descr.)

Todus hypochondriacus BRYANT.

Todus viridis DESM. II. N. Tang. pl. 67.—VIEILL. Gal. Ois. I, pl. 124 (1825).

Campephilus principalis var. *bairdi* Bd. BWR. & RIDGW. Hist. N. Am. Bds. II, p. 496 (1874).

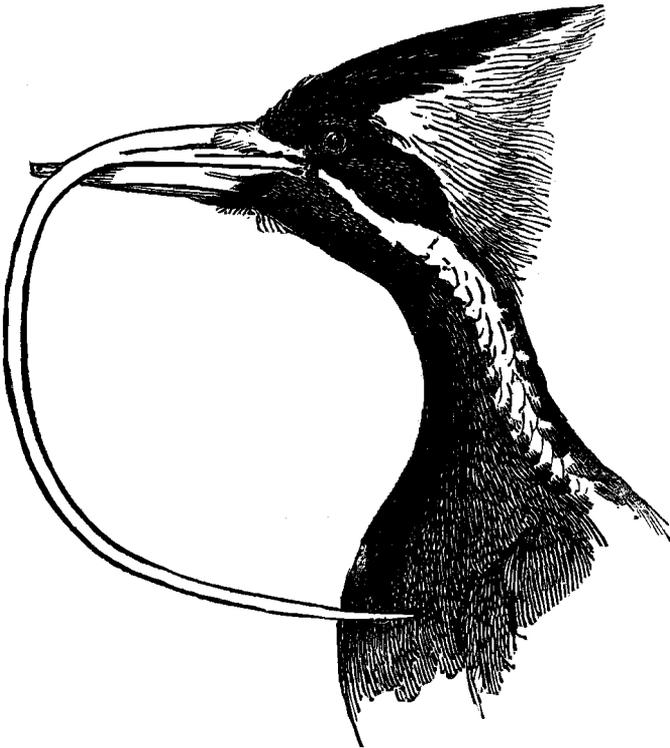

Campephilus principalis bairdi CORY, List Bds. W. I. p. 19 (1885).

“Much resembling *C. principalis*, but smaller and with the black anterior feathers of the crest larger than those succeeding, which are scarlet. White longitudinal line on the neck reaching quite to the base of the bill. In *C. principalis* the scarlet plumes of the crest are the longer, and the line on the neck does not extend to the base of the bill, both of which characters are very accurately shown in Audubon’s plates B. of Am. pl. 66, and oct. ed. IV, pl. 256. Colors of all other parts in the present bird are the same as those of *C. principalis*.

“Total length about 18½ inches, wing, 9¼, tail, 6¾ inches.” (CASSIN, l. c., orig. descr.)

HABITAT. Cuba.

I have now before me eighteen examples of *C. principalis* and two of *C. bairdi*, and have examined three other specimens of the latter bird. In none of the Cuban birds does the white cheek stripe quite reach the bill and in most of them it lacks a quarter of an inch or more. Some examples of *C. principalis* show the white stripe *nearly* as long as the Cuban form. The length of this stripe is quite variable in the series from Florida. The "black anterior feathers of the crest" do not appear to be a constant character, as two examples of *C. principalis* from Florida show it as much as any Cuban specimens which I have seen.

In Dr. Gundlach's private museum at Ingenio Fermina, Cuba, I had the pleasure of seeing a most curious *C. bairdi*, which might well be called an ornithological monstrosity. The bird was perfect in every respect with the exception of the upper mandible, which had grown to the enormous length of nearly twelve inches, curving downward and passing the body on the left side, as shown in the accompanying figure.

GENUS *Dryobates* BOIE.

Dryobates BOIE, Isis, 1826, p. 977.

Dryobates villosus insularis.

Picus villosus BRYANT, Pr. Bost. Soc. Nat. Hist. VII, p. 106 (1859).—

Picus insularis MAYN. The Nat. in Florida, I, No. 4 (1885).

Picus villosus insularis CORY, List Bds. W. I. p. 19 (1885).

SP. CHAR. *Male*.—Above black, with a white band down the middle of the back, finely lined with black; all the quills, middle and larger wing-coverts with numerous spots of white; crown black; a patch over the eye, and a stripe from the mandible to the nape white; a black stripe from the eye, passing through the cheeks, over the nape, and joining the black of the back; a scarlet crescent around the base of the skull, joining the white superciliary stripe; underparts ashy, with the sides mottled and striped with black; two outer tail-feathers white, edged and tipped with pale brown; third black, with a patch of pale brown upon the outer web, the others black.

Female.—The scarlet crescent wanting, replaced by white.

Length, 7.25; wing, 4.20; tail, 3; tarsus, .70; bill, 1.

HABITAT. Northern Bahama Islands.

This form differs from *P. villosus* in the greater extent of white in front of the eye, the black streaks on the sides of the breast, and black shaft-lines on the white feathers of the back.

GENUS *Sphyrapicus* BAIRD.

SP. CHAR.—Forehead dull white, extending in a superciliary stripe down the sides of the head to the neck; top of the head bright red; a narrow stripe of smoky black passing from the eye down the sides of the neck; a narrow stripe of black on the centre of the throat from the chin, succeeded on the lower throat and upper breast by a broad patch of red; sides of throat dull white; back and upper surface of wings yellowish green; middle portion of breast pale yellow; feathers on the sides of the body barred with smoky black and white, showing a tinge of yellow; primaries dark brown, blotched with dull white on the edges of the webs; inner primaries and secondaries heavily edged with pale green on the outer web; two central tail-feathers dull black, showing a silvery tinge when held in the light; under surface of the tail showing feathers with narrow alternate bands of gray and pale brown.

The female differs from the male in having the top of the head black, the feathers showing narrow shaft lines of white; the red restricted to the base of the skull.

Length, 9; wing, 5; tail, 3.50; tarsus, .80; bill, .90.

HABITAT. Cuba.

SP. CHAR. *Male*.—Top of the head pale yellowish brown, each feather having a central stripe of dark brown, giving the head a delicate striped appearance; a space around the eye, extending beyond the ear-coverts, pale rufous brown; a stripe of black passes from the under mandible down the sides of the throat; chin and throat black, the feathers edged with yellowish white; rest of plumage having the feathers banded with yellow and dark brown, brightest on the underparts; under wing-coverts pale yellow, somewhat marked with brownish; wings and tail dark brown, thickly banded with yellow; under surface of wings and tail showing the shafts of the feathers clear pale yellow, the shafts being brown on the upper surface.

Female.—Similar to the male, but having the head and cheeks browner, and lacking the black stripe on the side of the throat.

Length (skin), 12; wing, 6.25; tail, 5; tarsus, 1; bill, 1.60.

HABITAT. Cuba.

(*To be continued.*)

DESCRIPTIONS OF NEW SPECIES OF BIRDS FROM THE WEST INDIES.

BY CHARLES B. CORY.

Thryothorus guadeloupenis, sp. nov.

SP. CHAR.—Upper parts dark brown, showing darkest on the head; wing-coverts tipped with rufous brown; primaries and secondaries dark brown, the outer webs mottled with reddish brown, showing pale indistinct bands on some of the inner secondaries; entire underparts tawny brown; under tail-coverts tawny, heavily marked with dark brown; bill yellowish brown, under mandible quite pale; legs and feet pale; iris yellow.

The tail of the specimen above described is lacking.

Length, —; wing, 1.95; tarsus, .78; bill, .75.

HABITAT. Grand Terre, Guadeloupe, West Indies.
