

**Newton on 'Fossil Birds.'**\* — This is a brief survey of our present knowledge of fossil birds, the subject being treated in outline. It is, however, an important and instructive summary of the subject, presented by an eminent authority. As indicated by the title, it formed one of the long series of important papers read at the Second International Congress held last year at Budapest. — J. A. A.

**Sclater on the Geographical Distribution of Birds.**† — In this paper of some thirty-five pages, Dr. Sclater has summarized the recent progress in our knowledge of the geographical distribution of birds, the period covered being mainly the interval since the publication of his well-known address on Geographical Zoölogy delivered before the Biological Section of the British Association at its meeting at Belfast in 1875. He briefly re-states, with some qualifications, his views then and previously set forth, respecting the principal faunal regions and subregions of the earth's surface, based on a study of the geographical distribution of birds, and notes, *passim*, the leading recent authorities upon their ornithology. This is followed by an appendix of eight pages, in which are given the titles of the principal publications referred to, 125 in number. This list, with that contained in his British Association Address, forms a most convenient and useful guide to the more important works and papers bearing on the special subject here treated.

As is well known, Dr. Sclater's division of the earth's surface into six primary ontological divisions of coördinate value has been the subject of criticism from many sources; yet, while practically admitting that some other method of division might prove more in accordance with facts, he expresses himself as in the main, "after more than thirty-five years close attention to the subject," well satisfied with his own system, and believes (with Wallace, whose adoption of his principal regions he "points out with pride") that, in the words of Mr. Wallace, "in geographical equality, compactness of area, and facility of definition, they are beyond all comparison better than any others that have yet been proposed for the purpose of facilitating the study of geographical distribution" — as though "practical convenience," instead of the facts of distribution, were to be the deciding test in favor of this or that author's scheme! Thus, as Dr. Sclater says, many writers on zoö-geography have treated his "Nearctic Region as merely a piece of the Palæarctic," and he admits that "there are, no
