

**Hellmayr on the Types of Little-known Neotropical Birds.**<sup>1</sup>—The author, in collecting material for his proposed work on the 'Birds of Brazil,' soon found that in order to clear up the uncertainty of nomenclature existing respecting many of the species it would be necessary to examine the original types. "Thus," he says, "during the last four years, I have carefully examined a great number of types in various museums of Europe, and I intend to publish the results of these studies in a series of papers of which this is the first instalment." During the last two years several other papers on the same general subject have already appeared, some of which have been noticed in this journal. In the present paper 64 species are critically considered, in connection with which many nomenclatorial questions are discussed, often involving the detailed revision of specific groups, and new allocations of names. A list of the species treated is given at the end of the paper, showing at a glance the results reached. Dr. Hellmayr's researches in this field are most opportune and should receive cordial welcome.—J. A. A.

**Hellmayr on the Birds of Pará, Brazil.**—These 'Notes'<sup>2</sup> relate to a collection of birds received at the Tring Museum from Mr. W. Hoffmanns numbering "420 specimens, representing 120 species, of which no less than 21 are new to the fauna of Pará," while four are new to science, and others represent species previously known only from single specimens. Besides the localities, dates of collecting, and a transcript of the collector's notes on the color of the iris and soft parts, many technical and nomenclatorial notes are also included.—J. A. A.

**Wood's Twenty-five Years of Bird Migration at Ann Arbor, Michigan.**<sup>3</sup>—The area is the immediate vicinity of Ann Arbor, and the period, 1880 to 1905, inclusive; the number of species is 267. "The list includes all the species observed in this vicinity, and the record for each species shows whether it is common or rare." The main list forms a sheet 15¼ by 28¼ inches, and is entitled 'Table of First Arrivals,' Two other tabulations are 'Table of Migration Waves,' and 'Table of Species occurring on more than one Wave.' The period of greatest migration occurs the last week in April and the first week in May. The hardier birds, which arrive early, "do not come at a stated time each year, but are governed in their migration to a certain extent by favorable weather and food conditions." The later migrants tend to arrive at about the same time each year, and appear
