

McAtee's Spring Bird Lists.¹ Everyone in these days makes bird lists and the spirit of competition and the resulting desire to record the largest number of species are only human even though they are, as our author well says, "not for the best interests of ornithology."

Those who would counteract the tendency to inaccuracy, inevitably and unconsciously developed by competition, would do well to follow Mr. McAtee's admirable suggestions. He has insisted that the several persons making up the party on his "record walks" should *all* satisfactorily see each species before it is accepted for entry on the list, while species difficult to identify have been collected. Subspecies he wisely ignores as they are "scarcely a subject for field observation." This we consider an excellent practise for the observer who claims to be able to distinguish in the field, by sight alone, such races as the Northern and Southern Parula Warblers, the Northern and Southern Robin or the Northern and Southern Maryland Yellow-throat thereby places his entire list under suspicion.

Mr. McAtee's trip each year has been a continuous walk not a skipping from one point to another by rapid transit, and by selecting a definite route to be followed year after year the comparison of lists becomes more interesting than a comparison with lists made by others in a different section.

The actual number of species observed on these ten May walks varied from year to year from 73 to 101, while the largest lists were on May 11 and May 13, showing, as we should expect, that the height of migration of Warblers, etc., was reached about the middle of the month. The total number of species for the ten walks seems to be 146.

In commenting on the peak of the migration mention is made of the Connecticut Warbler, a species not found in any of the lists and excessively rare east of the Alleghanies in spring. We wonder if its mention was not a slip of the pen.—W. S.

Kopman, on the Wild Life Resources of Louisiana.²—This important contribution to the mammalogy and ornithology of Louisiana published as Bulletin 10 of the Department of Conservation is apparently the work of Mr. H. H. Kopman, although his name does not appear on either title page or cover. After preliminary remarks on the economic value of wild life there is a discussion of the natural divisions of the state and a map illustrating the extent of the marshes, prairies, and several wooded districts into which it is divided. Then follow detailed accounts of the habits, distribution, etc., of the more important mammals and game birds with nominal mention of probably all of the birds known to occur in the state.
