

June, 1928 he observed 152 species while notes on 12 additional species are added from the observations of others. The rediscovery of *Micrsiphonorhis brewsteri* was the outstanding feature of this trip and has already been described in 'The Auk' although additional data are presented here. Mr. Bond, we think rightly, considers that the genus must be merged with *Siphonorhis*. Two specimens of the interesting Thrush, *Haplocichla swalesi*, discovered by Dr. Alexander Wetmore a few years since, were obtained. As in the other paper Mr. Bond has presented much valuable data on the habits and distribution of the species as well as the native names. The two papers constitute a very valuable contribution to our knowledge of the West Indian avifauna and we trust that a third expedition which Mr. Bond is now undertaking will add still further data on the birds of this interesting region.—W. S.

deSchauensee on a Collection of Birds from Siam.—Mr. Rodolphe deSchauensee spent the greater part of the months of March and April collecting birds in Siam for the Academy of Natural Sciences of Philadelphia. Most of his time was spent at Bangkok, Chieng Mai, 450 miles north in the Lao district and Me Klong in central Siam. About 160 species were obtained and notes¹ on the habits and relationship of the various forms are presented as well as data on all of the specimens.

An interesting and distinct race of the Broadbill, *Corydon sumatranus laoensis* (p. 555) is described from Chieng Mai.

In addition to the specimens secured by Mr. deSchauensee and his native collectors, some 28 skins were purchased in Bangkok which are included in the report.

The author is back again in northern Siam and recent communications received from him state that he has obtained a still larger collection which will undoubtedly contain much of interest and add still further to our knowledge of the birds of this country.—W. S.

✓ **Taverner on the Birds of Belvedere, Alberta.**—This important list² of 205 species is based upon field work in the vicinity of Belvedere from May to October 1926 by a party consisting of P. A. Taverner, C. G. Harrold and H. M. Laing. The locality is already famous through the work of Mr. A. D. Henderson and those who have enjoyed the hospitality of his home and he and his friends have added greatly to our knowledge of the breeding habits of many of the northern birds. Notes by Rowan, Harlow and Rauch, who were engaged in field work simultaneously with Mr. Taverner's party, have been incorporated in the report as well as information furnished by Mr. Henderson.
