

THE CONDOR

A Magazine of
Western Ornithology

Published Bi-Monthly by the
Cooper Ornithological Club

J. GRINNELL, Editor

HARRY S. SWARTH, Associate Editor

J. EUGENE LAW

W. LEE CHAMBERS } Business Managers

Hollywood, California: Published Nov. 30, 1915

SUBSCRIPTION RATES

One Dollar and Fifty Cents per Year in the United States, payable in advance.

Thirty Cents the single copy.

One Dollar and Seventy-five Cents per Year in all other countries in the International Postal Union.

COOPER CLUB DUES

Two Dollars per year for members residing in the United States.

Two Dollars and Twenty-five Cents in all other countries.

Manuscripts for publication, and Books and Papers for Review, should be sent to the Editor, J. Grinnell, Museum of Vertebrate Zoology, University of California, Berkeley, California.

Claims for missing or imperfect numbers should be made of the Business Manager, as addressed below, within thirty days of date of issue.

Cooper Club Dues, Subscriptions to The Condor, and Exchanges, should be sent to the Business Manager.

Advertising Rates on application to the Business Manager.

Address W. Lee Chambers, Business Manager, Eagle Rock, Los Angeles County, California.

EDITORIAL NOTES AND NEWS

According to AVIFAUNA No. 11, California has 541 species and subspecies of birds. It may be of interest to compare this figure with those for other states. Myron H. Swenk (in *Nebraska Blue Book*, 1915, page 835) has assembled the following data. There is as yet no report for Texas, but that state probably follows California as a close second. Nebraska comes third with 418 species (Swenk, 1915); then, west of the Mississippi, Colorado with 397 (Cooke, 1911), Kansas with 379 (Bunker, 1913), Missouri with 383 (Widmann, 1907), Iowa with 354 (R. M. Anderson, 1907), and Arkansas with 255 (A. H. Howell, 1911). East of the Mississippi the largest list seems to be that of New York with 411 (Eaton, 1910-14), while Maine has 327 (Knight, 1908), Connecticut 329 (Sage and Bishop, 1913), West Virginia 246 (Brooke, 1913), Michigan 326 (W. B. Barrows, 1912), Illinois and Wisconsin, combined, 398 (Cory, 1909), and Alabama 275 (Oberholser, 1909). Westwardly, Washington has 372 species (Dawson and

Bowles, 1909) and Arizona 362 (Swarth, 1914).

Mr. W. C. Bradbury, a retired capitalist of Denver, has been devoting most of his time the past three years to assembling a collection of birds' eggs for the Colorado Museum of Natural History, of which institution he is a trustee. His efforts have resulted in a representation of some 600 different species, with many fine series, occupying twenty-eight large show-cases. As can be readily inferred new things are now coming in very slowly.

William Alanson Bryan, Professor in the College of Hawaii, has just gotten out a book entitled "Natural History of Hawaii." Of the five "sections," one is devoted to the animal life of the archipelago, and of this section a consideration of its remarkable bird-life naturally occupies the larger part. Mr. Bryan is, of course, especially well equipped to handle this part of his subject with authority and in entertaining style.

We have to record the sad news of the death of Gaylord K. Snyder, active member of the Cooper Ornithological Club, who passed away at his home in Los Angeles, August 28, 1915. Mr. Snyder was a young man of most pleasing personality, a frequent attendant at Southern Division meetings, where his presence will be greatly missed, and an occasional contributor to THE CONDOR. In his untimely death the Club has sustained a distinct loss.

PUBLICATIONS REVIEWED

LITTLE BIRD BLUE | By WILLIAM L. and
IRENE FINLEY | with illustrations by | R.
Bruce Horsfall | and from photographs |
[vignette] | Boston and New York | Hough-
ton Mifflin Company | The Riverside Press
Cambridge | 1915 | ; pp. 1-60. (\$0.75 net.)

The offering of the above title is a charming little volume which may be read aloud to the children as a bedtime story; and then around the circle it must go for each little auditor to look long and lovingly at little Bird Blue perched on Phoebe Katherine's head or William's careful fingers,—and suddenly we realize that it is long past the children's bedtime!

The story deals with three months in the life of a bluebird, from the time he was found orphaned and nearly dead in the nest box under the eaves until he answered the call of his race one autumn day.

The recital of Bird Blue's rearing interests the children greatly and brings to them many bits of wisdom regarding birds and bird conservation; while the photographs reproduced in the book are a perfect delight to child-lovers and bird-lovers alike. The drawings are for the most part good. However, we refuse to accept the "sharp-fanged creature" on page 12 as a prowling cat! It

seems to us that a cat which looked less like a ravenous lion and more like a demure pussy would better make us realize that it is not only the starving outcast which menaces our bird-life but also the purring feline by the hearthside.—H. W. GRINNELL.

OUR SHOREBIRDS AND THEIR FUTURE. BY WELLS W. COOKE, Assistant Biologist, Bureau of Biological Survey. [From Yearbook of Department of Agriculture for 1914, pp. 275-294, pls. 21-23, figs. 16-18.]

In this paper Professor Cooke sets forth accurately and forcibly the main facts and factors in the shorebird situation. The diminution which began to be noticeable in the seventies continued at an accelerated rate, owing to excessive shooting, until several once plentiful species were threatened with extermination, and one of them had actually become extinct. It is emphasized that this was the result of the poorest sort of business policy; for the sport value of our shorebirds is great, and with an approach to former numbers should amount to vastly more. The recently enacted Federal regulations give promise of relieving the stress put upon the birds by spring-shooting. But only time will show whether or not these regulations are sufficient to cause a definite return towards former numbers. A slight improvement is thought by some to be already apparent.

Of course, with such species as depended at one season or another upon territory now under close cultivation, no great revival can be expected. Thus the Upland Plover, Mountain Plover, and Long-billed Curlew have had their breeding grounds largely appropriated for wheat raising or dairying. On the other hand, the Wilson Snipe and Woodcock must rest their cases chiefly in the hands of the gunner, or rather, in the laws which govern the gunner; for there is yet plenty of land suited to summering and to wintering of these birds.

There could be no better illustration of the practical application of purely scientific knowledge, than in the present instance, where the proper treatment of a valuable National asset must rest upon the accumulation of facts in distribution and migration of birds. The worthy efforts of Professor Cooke and his co-workers in the United States Biological Survey to ascertain the facts of bird migration, and to solve the complex problems presented, have occupied years. Marked success has been achieved, enough of success to now warrant generalizations of great economic importance as well as of deep scientific value. But prob-

lems remain, and vastly more facts must be garnered; nothing must be allowed to interrupt the course of these painstaking investigations.

The paper here noticed can be had for the asking; and because of the interest attaching to its subject and the fascinating style in which this subject is treated, there is every reason why each Cooper Club member should possess himself of a copy,—and not only that, but profit by knowing every bit of its contents.—J. GRINNELL.

A DISTRIBUTIONAL LIST OF THE BIRDS OF CALIFORNIA, by JOSEPH GRINNELL. (Pacific Coast Avifauna Number 11. Published by the Cooper Ornithological Club, October 21, 1915. Pp. 1-217, 3 plates.)

Every student of California birds, whether the amateur, painstakingly groping toward an acquaintance with the commoner species, or the advanced specialist in search of accurate information, will acclaim the appearance of this publication as something greatly needed, and, as need hardly be said, exceptionally well done. Dr. Grinnell, both from his official position and personal predilection, has been in a peculiarly advantageous situation for the production of this work, the activities of the museum of which he is the head being largely directed toward the accumulation of data relating to the distribution of California animals, while as editor of *THE CONDOR* he is naturally in a favorable position for hearing of the discoveries of others.

The real need of such a distributional list is shown in the exhaustion of the edition of the same author's "Check-List of California Birds" (*Pacific Coast Avifauna* No. 3), for which, though out of print several years, there are inquiries constantly received at the Cooper Club's business office. The present publication is an amplification of the earlier "Check-List", covering no wider a scope, but treating the subject with an elaboration of detail justified by the great accumulation of data since acquired. It treats purely of the distribution of species within the state of California, other phases, of life history or systematic status, being ignored save as incidental to the elucidation of ranges.

Statements of distribution, more especially of land birds, are made largely in terms of "life zones" and "faunal areas", and the whole book, in the resulting conciseness of phrase and clear conveyance of ideas, is a striking justification, or rather exemplification, of the practical usefulness—the
