Status and distribution of Redshanks *Tringa totanus* breeding along Mediterranean coasts

Roberto Valle & Francesco Scarton

Valle, R. & Scarton, F. 1996. Status and distribution of Redshanks *Tringa totanus* breeding along Mediterranean coasts. *Wader Study Group Bull.* 81: 66-70.

A detailed list of sites and an estimate of each local population are given for Redshanks breeding along the Mediterranean coastline. The total population is estimated at 2 252-2 691 pairs, mostly concentrated in Italy (about 1 100 pairs) and Greece (600-650 pairs); the coasts of Albania, Tunisia, Spain, France and Turkey are of lesser importance for breeding Redshank.

R. Valle, Castello 618/E, 30122 Venezia, Italy.

F. Scarton, Via Tevere 82, 30173 Mestre (VE), Italy.

INTRODUCTION

The status and distribution of Redshanks *Tringa totanus* breeding in the Mediterranean (*sensu stricto*) is largely unknown. Population estimates are available only for Spain (Cramp & Simmons 1983), France (Yeatman-Berthelot & Jarry, 1994), ex-Jugoslavia (Bartovsky *et al.* 1987), Tunisia (Urban *et al.* 1986), with a comprehensive census available only for Italy (Valle *et al.* 1995). This paper goes some way to describe the status of the Redshank breeding in the Mediterranean coastal area and provides the first estimate of the numbers of birds breeding in the whole of this area.

METHODS

Data were collected in 1993-1996 through contact with scientific associations, institutions and experts who had direct information about the birds of Mediterranean countries. Each was asked to provide detailed information about breeding sites, number of pairs and, where possible, more general observations on the breeding of Redshanks in their area. About forty experts answered, providing very recent data. Only for some sites there were there no up-to-date information, whilst for the Montenegro coastline it was not possible to have any kind of data. When we had two estimates for the same site, we report both. A site is

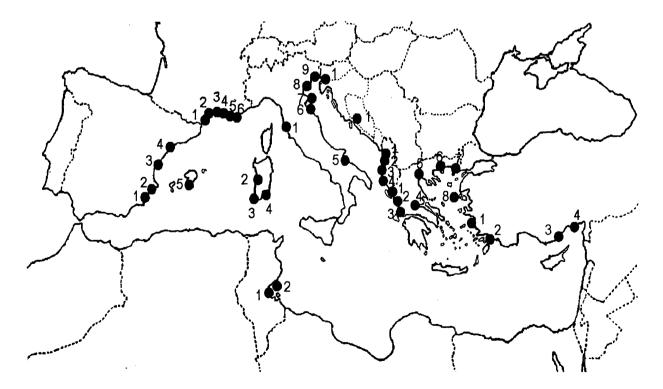

Figure 1. Map of breeding sites of Redshank along Mediterranean coasts. Numbers relate to site names in Table 1.

defined as an area (of varying size, from a few hectares to several thousands) where a discrete population of Redshank exists.

Each site mentioned by the local experts was reported on a map of the whole Mediterranean; the English names for the breeding sites are given, whenever possible, according to Grimmet & Jones (1989).

For some countries the totals reported to us sometimes do not correspond to the arithmetical sum of the sites, since information may be lacking for some breeding sites or whole areas. If not provided by the correspondents, we calculated the total number of breeding pairs in each country. We arbitrarily defined as coastal any population breeding within 30 km from the coastline. Only in some instances we reported data from non coastal sites, if they were of particular importance at a country level.

RESULTS

The results of our survey are summarised in Table 1, while Figure 1 illustrates the location of each site mentioned in the Table. A short comment on status in each country is given below.

Spain

The Mediterranean coasts of Spain hosts about a third of the population breeding in the whole country, *i.e.* 300-450 pairs (Velasco pers. comm.). The main breeding site is the Ebro Delta hosting 67 pairs (Bull. Parc Nat. Delta de l'Ebre 1992); other sites with a few pairs each, all of them totalling 18-58 pairs (Velasco pers. comm.), are scattered over the whole coastline, including the island of Mallorca. The small size of the Spanish coastal population is consistent with a previous paper reporting 10-50 breeding pairs for the same area (Martinez-Vilalta 1985).

France

Mediterranean France hosts a small population of 69-132 pairs, mostly concentrated in Camargue. For this site, the breeding population ranges from 47 pairs (Pineau pers. comm.) to about 100 pairs (Walmsley pers. comm.); Isenmann (1993) states that 20 to 60 pairs breed each year in the brackish areas. Mainly isolated pairs are found all along the remaining coastline (Dhermain, Brun & Pineau pers. comm.; GRIVE 1993). At least at the Berre Saltpans, an unprotected site, the few breeding pairs are threatened by human activities such as jogging and nest destruction (Dhermain pers. comm.).

Italy

The Italian population amounts to 1075-1181 pairs, 90% of which are located in the Venetian Lagoon. Minimal populations or single pairs are scattered on the remaining sites (Valle *et al.* 1995). The previous estimate of 300-600 breeding pairs (by Rallo in Tinarelli & Baccetti 1989) in the Venetian Lagoon has to be considered excessively low. Likewise, the report of 1000 non-breeding birds in the same area has to be rejected. In effect, though in

other breeding sites (Sardinia) flocks of tens of nonbreeding birds are usually observed (Grussu pers. comm.) no evidence of non-breeding birds has been found in the Venetian Lagoon during the past 10 years (Valle & Scarton 1995). Two other sites of much lesser importance, each one holding about 50 pairs, are also located in the north-western Adriatic coast: the Po Delta and some wetlands of the Emilia-Romagna region. Sardinia as a whole held 8-28 pairs in 1994 and 8-17 pairs in 1995 (Grussu pers. comm.); in the Grado-Marano Lagoon the breeding of up to twenty pairs is likely.

Slovenia

In the Cerknica Lake, the only site for this country and located at about 50 km from the coastline, a small population of 4-8 pairs is present, with the first breeding reported in 1985 (Slavko 1993).

Croatia

A population of 30-50 pairs breed in two flooded fields; this is the only breeding site in the country. Other possible nesting sites have not been checked, due to the war (Radovic pers. comm.; Susic pers. comm.).

Serbia-Montenegro

This species was not reported breeding in Montenegro in a recent review on the breeding waders in Yugoslavia (Bartovsky *et al.* 1987). No further data were obtained.

Albania

According to an ornithological survey made in 1993, the nearly 400-km long coastline of Albania is estimated to hold 175-225 pairs; detailed data are available only for a few sites (Vangeluwe pers. comm.).

Greece

Redshank is a fairly common wader in Greece, with an estimated population of 700-750 pairs, breeding almost entirely at some coastal sites; the most important are the Axios and Nestos Deltas (Handrinos & Akriotis in press). It must be emphasised that very little is known on the ecology of this species in Greece (Goutner, Hallmann, Handrinos, pers. comm.).

Cyprus

No evidence of breeding Redshanks has been found in this country (van den Berk pers. comm.).

Turkey

About 10 000-100 000 Redshanks pairs are believed to breed in Turkey (Magnin pers. comm.) but no recent information are available (Hale pers. comm.). However, the entire coastline supports only 50-90 breeding pairs (Kasparek pers. comm.) with a strictly Mediterranean population, including the Aegean coasts and excluding the Black Sea, of about 50 pairs (Kasparek pers. comm.; van den Berk pers. comm.). In this area few sites host small groups of breeders; in the Büyük Menderes Delta, Table 1. Population and distribution of Redshank *Tringa totanus* breeding along Mediterranean coasts (only sites within 50 km from the coast have been included).

+ = confirmed breeding in recent years, but present status unknown (P) = probable or possible breeding

Brinkmann *et al.* (1990) counted four pairs in 1989. On the south coast, the Göksu Delta was well covered in 1989, 1991 and 1992; in the first year breeding was thought possible, but in the following years no proof of breeding were found, although Redshanks were present year-round (van den Berk pers. comm.). The same applies for the Çukurova wetlands, where extensive surveys were made in 1987 and 1990 (van den Berk pers. comm.).

Syria

No evidence of breeding Redshanks has been found in the whole country (Hanna pers. comm.). Nevertheless, in non-coastal habitats, nesting could not be excluded on the Golan heights, which has some suitable habitat (Keijl pers. comm.) and in the northern part of the country (Kasparek pers. comm.).

Lebanon

No breeding pairs are present in Lebanon, due to the lack of suitable habitat (Kasparek pers. comm.).

Israel

The species does not breed in the Country (Keiji, Blitzblau & Langer pers. comm.). Nevertheless, Blitzblau (pers. comm.) reports territorial behaviour observed along the Carmel coast.

Egypt

According to Goodman & Meininger (1989) Redshank does not breed in this country.

Libya

The Redshank has never been reported breeding in Libya and no evidence of breeding was found during a recent survey (Meininger et al. 1994).

Tunisia

In this country, 200-250 pairs were reported by Cramp & Simmons 1983 and by Urban *et al.* 1986. No more recent data have been obtained about the size of the entire population. Breeding pairs were reported being mostly located in the Gulf of Gabes (van den Berk pers. comm.). The Kneiss area supports a small population of 19-25 pairs (van Dijk 1993), which breed in loose colonies (Keijl pers. comm.).

Algeria

The species does not breed in the country (Boukalfa pers. comm.).

Morocco

No evidence of breeding has been found for this country (El Ghazi & Thevenot pers. comm.).

CONCLUSIONS

The information gathered allows us to estimate the Redshanks breeding along the Mediterranean coastline at 2 252-2 691 pairs. About 60 sites have been identified, mostly in lagoons and saltpans. Along the Mediterranean coastline the largest population inhabits the Venetian Lagoon, which hosts about the 40% of total. In this area breeding Redshanks are mostly concentrated in colonies of 20-200 pairs, located in small saltmarsh islets (Valle *et al.* 1994). The existence of these islets is threatened by several natural and man-made factors such as compaction of sediments, erosion and sea-level rise (Day *et al.* 1995). Greece supports another 600-650 pairs, but more detailed information are needed for this country. The same applies to Tunisia and Albania, which should host about 200 pairs each. Good data are available for the Spanish and French coasts which support only limited numbers, about 100 pairs each. More precise information are clearly needed to assess the importance of each site and the actual trend for the Mediterranean coastal populations.

ACKNOWLEDGMENTS

We are greatly indebted to all those experts who kindly allowed us to use their data or gave useful information, without which our synthesis would have not been possible: L.J. Alberto, V. van den Berk, S. Blitzblau, D. Boukhalfa, J. Boutin, L. Brun, B. Calvo, J. Crivelli, F. Dhermain, A. El Ghazi, P. de Goeij, V. Goutner, M. Grussu, B. Hallmann, G. Handrinos, I. Hanna, T. van der Have, G.E. Hollis, J. Hughes, A. Johnson, M. Kasparek, G. Keijl, G. Kirwan, K. Koffijberg, J. Langer, J.A. Lorenzo, G. Magnin, A. Martinez-Vilalta, P. Meininger, A. Perez-Hurtado, O. Pineau, A. Psilovikos, D. Radovic, G. Susic, M. Thevenot, D. Tome, T. Velasco, J.G. Walmsley, D. Wangeluwe and M. Yarar.

We are particularly grateful to V. van den Berk, F. Dhermain, M. Grussu, G. Handrinos, J.A. Lorenzo, M. Kasparek, G. Keijl, P. Meininger, O. Pineau, T. Velasco and D. Wangeluwe for their helpful comments and advice. Professor W.G.Hale kindly revised an early draft of the text and gave useful suggestions.
